1 Introduction

What is this? What follows is an experiment where I construct programs according to certain rules. While I do not list what these rules are, the following are a sketch of the sort of rules I have in mind:

1. The instruction "verify that $a = a$ " is legal if it occurs after "choose an integer a "
2. The instruction "verify that $b = a$ " is legal if it occurs after "verify that $a = b$ "
3. The instruction "verify that $a = c$ " is legal if it occurs after "verify that $a = b$ " and "verify that $b = c$ "
4. The instruction "verify that $(a + b) + c = a + (b + c)$ " is legal if it occurs after "choose integers a, b, c "

Why was this made? I wanted to see whether programs constructed according to certain rules can serve a similar function to mathematical proofs. For example, let A be the 100×100 matrix containing the multiplication table up to 100. At least to me, seeing the form of [procedure 22](#) allows me to be confident enough to bet that $|A^2| = |A|^2$ without carrying out the necessary computations. And if they should not turn out to be equal, then I would conclude that the rules according to which I made [procedure 22](#) were inappropriate for the purposes of evidence.

How do I understand this? The task of understanding the following procedures should be the same as that of understanding any codebase. Hence running a debugger, that is, executing the following procedures step by step on some chosen input(s) and observing their control flows and sequences of program states should be equally helpful in making sense of them.

The objective of the following instructions is to make $A_{1,2} = 0$, $\deg(A_{1,1}) \leq k$, and either leave $A_{*,1}$ unchanged or make $\deg(A_{1,1}) < q$ by a sequence of operations whereby, in each step a $\mathbb{Q}[x]$ times either of the columns is added to the other.

2.1.2 Implementation

1. Let A be our working matrix.
2. While $A_{1,2} \neq 0$, do the following:
 - (a) If $\deg(A_{1,1}) \leq \deg(A_{1,2})$, then:
 - i. Subtract $\frac{x^{\deg(A_{1,2}) \circ A_{1,2}}}{x^{\deg(A_{1,1}) \circ A_{1,1}}} x^{\deg(A_{1,2}) - \deg(A_{1,1})}$ times $A_{1,1}$ from $A_{1,2}$.
 - ii. Now verify that either $A_{1,2}$'s degree has decreased or $A_{1,2} = 0$.
 - (b) Otherwise, do the following:
 - i. Let $p = \frac{x^{\deg(A_{1,1}) \circ A_{1,1}}}{x^{\deg(A_{1,2}) \circ A_{1,2}}} x^{\deg(A_{1,1}) - \deg(A_{1,2})}$.
 - ii. If $A_{1,1} = pA_{1,2}$, then do the following:
 - A. Add $1 - p$ times $A_{1,2}$ to $A_{1,1}$.
 - B. Verify that now $A_{1,1} = A_{1,2}$.
 - iii. Otherwise, do the following:
 - A. Verify that $A_{1,1} \neq pA_{1,2}$.
 - B. Add $-p$ times $A_{1,2}$ to $A_{1,1}$.
 - iv. Therefore verify that $A_{1,1} \neq 0$.
 - v. Also verify that $A_{1,1}$'s degree has decreased.
3. **Verify that** $A_{1,2} = 0$.
4. Verify that the changes to $A_{1,1}$, if any, have decreased its degree.
5. If sensical, do the following:
 - (a) Verify that all changes to $A_{1,2}$ but the last have decreased its degree.
 - (b) Verify that $\deg(A_{1,1}) \leq$ the degree of the penultimate value of $A_{1,2}$.
6. **Therefore verify that** $\deg(A_{1,1}) \leq k$.
7. If $A_{*,1}$ was changed, then do the following:
 - (a) Verify that $A_{1,1}$ was also changed.
 - (b) **Therefore verify that** $\deg(A_{1,1}) < q$.
8. **Yield the tuple** $\langle A \rangle$.

Let us use the notation "diagonal" as a shorthand for "matrix positions such that the row index equals the column index".

Let us use the notation $\mathcal{D}_{m,n}(A)$ as a shorthand for " $\mathcal{M}_{m,n}(A)$ with 0s in all the off-diagonal positions".

2.2 Procedure 2

2.2.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . The objective of the following instructions is to transform A into a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ by a sequence of operations whereby either a $\mathbb{Q}[x]$ times any of the columns is added to a different column, or a $\mathbb{Q}[x]$ times any of the rows is added to a different row.

2.2.2 Implementation

1. If $m = 0$ or $n = 0$, then do the following:
 - (a) **Verify that** A is a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$.
 - (b) **Yield the tuple** $\langle A \rangle$.
2. Otherwise do the following:
3. Verify that $m > 0$ and $n > 0$.
4. Let A be our working matrix.
5. Now do the following:
 - (a) While there are non-zero entries in the top row less its first entry, do the following:
 - i. In the first row, select the $\mathcal{M}_{m,2}(\mathbb{Q}[x])$ whose top-right entry coincides with the last non-zero entry of the first row
 - ii. Apply **procedure 1** on this submatrix.
 - iii. Verify that the top-left and top-right entries of the submatrix are now non-zero and zero respectively.
 - iv. If the first column of A was modified by (5aii), then do the following:
 - A. Verify that $\deg(A_{1,1})$ decreased.
 - B. Go back to (5).
 - (b) Now do the same operations as in (a), but this time with the operations themselves reflected across the matrix's diagonal.
6. Verify that, except for the top-left entry, the first row and the first column are zero.

7. Apply **procedure 2** on the submatrix $A_{[2:m+1],[2:n+1]}$.
8. Verify that (7)'s execution leaves the first row and column unchanged.
9. **Verify that A is now a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$.**
10. **Yield the tuple $\langle A \rangle$.**

2.3 Procedure 3 (Associativity verification)

2.3.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A , a $\mathcal{M}_{n,p}(\mathbb{Q}[x])$, B , and a $\mathcal{M}_{p,q}(\mathbb{Q}[x])$, C . The objective of the following instructions is to show that $(AB)C = A(BC)$.

2.3.2 Implementation

1. Verify that $(AB)_{i,l} = \sum_{k=1}^n (A_{i,k} * B_{k,l})$ for $1 \leq i \leq m$, for $1 \leq l \leq p$.
2. Verify that $((AB)C)_{i,r} = \sum_{l=1}^p ((AB)_{i,l} * C_{l,r}) = \sum_{l=1}^p (\sum_{k=1}^n (A_{i,k} * B_{k,l}) * C_{l,r})$ for $1 \leq i \leq m$, for $1 \leq r \leq q$.
3. Verify that $(BC)_{k,r} = \sum_{l=1}^p (B_{k,l} * C_{l,r})$ for $1 \leq k \leq n$, for $1 \leq r \leq q$.
4. Verify that $(A(BC))_{i,r} = \sum_{k=1}^n (A_{i,k} * (BC)_{k,r}) = \sum_{k=1}^n (A_{i,k} * \sum_{l=1}^p (B_{k,l} * C_{l,r}))$ for $1 \leq i \leq m$, for $1 \leq r \leq q$.
5. Therefore Verify that
$$\begin{aligned} \sum_{l=1}^p (\sum_{k=1}^n (A_{i,k} * B_{k,l} * C_{l,r})) &= \\ \sum_{k=1}^n (\sum_{l=1}^p (A_{i,k} * B_{k,l} * C_{l,r})) &= \\ \sum_{k=1}^n (A_{i,k} * \sum_{l=1}^p (B_{k,l} * C_{l,r})) &= \end{aligned} \quad (4) \quad \text{for } 1 \leq i \leq m, \text{ for } 1 \leq r \leq q.$$
6. **Therefore verify that $(AB)C = A(BC)$.**

Let us use the notation I_n as a shorthand for "the $\mathcal{M}_{n,n}(\mathbb{Q})$ with only 1s on the diagonal and 0s everywhere else" in what follows.

Let us use the notation $\mathcal{T}_m(\mathbb{Q}[x])$ as a shorthand for " $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ with only 1s on the diagonal, a single $\mathbb{Q}[x]$ off the diagonal, and 0s everywhere else" in what follows.

2.4 Procedure 4 (Row and column operation recording)

2.4.1 Objective

Choose a procedure, A , and two non-negative integers m, n . The objective of the following instructions is to construct a list of $\mathcal{T}_m(\mathbb{Q}[x])$ s, M , and a list of $\mathcal{T}_n(\mathbb{Q}[x])$ s, N such that $M_{|M|+1-i}$ equals I_m after applying the i^{th} row operation carried out by A also on it, and N_i equals I_n after applying the i^{th} row operation carried out by A also on it.

2.4.2 Implementation

1. Make an empty list, N .
2. Augment procedure A so that each time a polynomial x times a column i is added onto column j , an $n \times n$ matrix that only has 1s on its diagonal, and such that the only non-zero entry off its diagonal is x at position (i, j) , is appended onto N .
3. Make an empty list, M .
4. Also augment procedure A so that each time a polynomial x times a row i is added onto row j , an $n \times n$ matrix that only has 1s on its diagonal, and such that the only non-zero entry off its diagonal is x at position (j, i) , is prepended onto M .
5. Now run procedure A .
6. **Yield the tuple $\langle M, N \rangle$.**

2.5 Procedure 5 (Multiplication by identity)

2.5.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . The objective of the following instructions is to show that $I_m A = A = A I_n$.

2.5.2 Implementation

1. For $1 \leq r \leq m$, do the following:
 - (a) For $1 \leq t \leq n$, do the following:

$$\begin{aligned} \text{i. Verify that } (I_m A)_{r,t} &= \\ \sum_{u=1}^m (I_m)_{r,u} A_{u,t} &= (I_m)_{r,r} A_{r,t} = \\ 1 * A_{r,t} &= A_{r,t}. \end{aligned}$$

2. Therefore verify that $I_m A = A$.

3. For $1 \leq r \leq m$, do the following:

(a) For $1 \leq t \leq n$, do the following:

$$\begin{aligned} \text{i. Verify that } (AI_n)_{r,t} &= \\ \sum_{u=1}^m A_{r,u} (I_n)_{u,t} &= A_{r,t} (I_n)_{t,t} = \\ A_{r,t} * 1 &= A_{r,t}. \end{aligned}$$

4. Therefore verify that $AI_n = A$.

Let us use the notation M_* as a shorthand for " $\prod_{i=1}^{|M|} M_i$ " in what follows.

2.6 Procedure 6 (Matrix list inversion)

2.6.1 Objective

Choose a list of $\mathcal{T}_m(\mathbb{Q}[x])$, A . The objective of the following instructions is to define a list of $\mathcal{T}_m(\mathbb{Q}[x])$, A^{-1} , such that $A_* A^{-1}_* = I_m$.

2.6.2 Implementation

1. Let A^{-1} be $\langle \rangle$.
2. For $i = 1$ to $i = |A|$, do the following:
 - (a) Let (j, k) be the position of the off diagonal entry of A_i .
 - (b) Let B equal A_i but with entry (j, k) negated.
 - (c) For $1 \leq r \leq m$ and $r \neq j$, do the following:
 - i. For $1 \leq t \leq m$, do the following:
$$\begin{aligned} \text{A. Verify that } (A_i B)_{r,t} &= \\ \sum_{u=1}^m (A_i)_{r,u} B_{u,t} &= (A_i)_{r,r} B_{r,t} = \\ 1 * B_{r,t} &= [r = t]. \end{aligned}$$
 - (d) For $1 \leq t \leq m$ and $t \neq k$, do the following:
 - i. Verify that $(A_i B)_{j,t} = \sum_{u=1}^m (A_i)_{j,u} B_{u,t} = (A_i)_{j,t} B_{t,t} = (A_i)_{j,t} * 1 = [j = t]$.
 - (e) Verify that $(A_i B)_{j,k} = \sum_{u=1}^m (A_i)_{j,u} B_{u,k} = (A_i)_{j,j} B_{j,k} + (A_i)_{j,k} B_{k,k} = 1 * B_{j,k} + (A_i)_{j,k} * 1 = B_{j,k} + (A_i)_{j,k} = 0$.

(f) Therefore verify that $A_i B = I_m$.

(g) Now prepend B onto A^{-1} .

3. Verify that $|A| = |A^{-1}|$.

4. Therefore using **procedure 3** and **procedure 5**, verify that $A_* A^{-1}_* = A_1 \cdots A_{|A|-1} A_{|A|} A^{-1}_1 A^{-1}_2 \cdots A^{-1}_{|A|} = A_1 \cdots A_{|A|-2} A_{|A|-1} I_m A^{-1}_2 A^{-1}_3 \cdots A^{-1}_{|A|} = A_1 \cdots A_{|A|-2} A_{|A|-1} A^{-1}_2 A^{-1}_3 \cdots A^{-1}_{|A|} = \cdots = A_1 I_m A^{-1}_{|A|} = A_1 A^{-1}_{|A|} = I_m$.

2.7 Procedure 7

2.7.1 Objective

Choose a list of $\mathcal{T}_m(\mathbb{Q}[x])$, A . The objective of the following instructions is to show that $(A^{-1})^{-1} = A$ and $A^{-1}_* A_* = I_m$.

2.7.2 Implementation

1. Verify that $(A^{-1})^{-1} = A$.
2. Therefore using **procedure 6**, verify that $A^{-1}_* A_* = A^{-1}_* (A^{-1})^{-1}_* = I_m$.

2.8 Procedure 8

2.8.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . The objective of the following instructions is to define the polynomials $u_1, u_2, \dots, u_{\min(m,n)}$ and transform A into a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ such that $A_{k,k} = u_k A_{1,1}$ for $1 \leq k \leq \min(m,n)$ by a sequence of operations whereby either a $\mathbb{Q}[x]$ times any of the columns is added to a different column, or a $\mathbb{Q}[x]$ times any of the rows is added to a different row.

2.8.2 Implementation

1. Let $u = \langle 1 \rangle$.
2. For j going from 2 to $\min(m,n)$, do the following:
 - (a) Verify that $A_{k,k} = u_k A_{1,1}$ for $k = 1$ to $k = |u|$.
 - (b) Add row j to row 1.

- (c) Now verify that $A_{1,j} = A_{j,j}$.
 - (d) Set $A' = A$ and let A' be our working matrix.
 - (e) Let $\langle M, N \rangle$ receive the results of executing **procedure 4** on the pair $\langle m, n \rangle$ and the following procedure:
 - i. Execute **procedure 1** on the submatrix of A' formed by selecting row 1 and columns 1 and j as if there were nothing in between.
 - (f) Now verify that:
 - i. M is empty.
 - ii. $AN_* = M_*AN_* = A'$.
 - iii. $A = AI_n = AN_*N^{-1}_* = A'N^{-1}_*$.
 - iv. $A'_{1,j} = 0$.
 - v. $A_{1,1} = A'_{1,1}N^{-1}_{*1,1} + A'_{1,j}N^{-1}_{*j,1} = A'_{1,1}N^{-1}_{*1,1}$.
 - vi. $A_{j,j} = A_{1,j} = A'_{1,1}N^{-1}_{*1,j} + A'_{1,j}N^{-1}_{*j,j} = A'_{1,1}N^{-1}_{*1,j}$.
 - vii. $A_{j,1} = 0$.
 - viii. $A'_{j,1} = A_{j,1}N_{*1,1} + A_{j,j}N_{*j,1} = A_{j,j}N_{*j,1} = A'_{1,1}N^{-1}_{*1,j}N_{*j,1}$.
 - ix. $A'_{j,j} = A_{j,1}N_{*1,j} + A_{j,j}N_{*j,j} = A_{j,j}N_{*j,j} = A'_{1,1}N^{-1}_{*1,j}N_{*j,j}$.
 - (g) Subtract $N^{-1}_{*1,j}N_{*j,1}$ times row 1 from row j .
 - (h) Now verify that $A'_{j,1} = 0$.
 - (i) For $k = 2$ to $k = |u|$, do the following:
 - i. Verify that $A'_{k,k} = A_{k,k} = u_k A_{1,1} = u_k A'_{1,1}N^{-1}_{*1,1}$.
 - ii. Set $u_k = u_k N^{-1}_{*1,1}$.
 - iii. Hence verify that $A'_{k,k} = u_k A'_{1,1}$.
 - (j) Let $u_j = N^{-1}_{*1,j}N_{*j,j}$.
 - (k) Hence verify that $A'_{j,j} = u_j A'_{1,1}$.
 - (l) Now let $A = A'$.
3. **Hence verify that $A'_{k,k} = u_k A'_{1,1}$ for $k = 1$ to $k = \min(m, n)$.**
4. **Yield $\langle u \rangle$.**

2.9 Procedure 9 (Block matrix multiplication)

2.9.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A , and a $\mathcal{M}_{n,k}(\mathbb{Q}[x])$, B . Choose integers $1 \leq a \leq m$, $1 \leq b \leq n$, and $1 \leq c \leq k$. The objective of the following instructions is to show that $(AB)_{[1:a],[1:c]} = A_{[1:a],[1:b]}B_{[1:b],[1:c]} + A_{[1:a],[b:n+1]}B_{[b:n+1],[1:c]}$.

2.9.2 Implementation

1. Multiply matrix A by matrix B .
2. For each $1 \leq i \leq a - 1$, do the following:
 - (a) For each $1 \leq j \leq c - 1$, do the following:
 - i. Verify that $(AB)_{i,j} = \sum_{p=1}^n A_{i,p}B_{p,j} = \sum_{p=1}^{b-1} A_{i,p}B_{p,j} + \sum_{p=b}^n A_{i,p}B_{p,j} = \sum_{p=1}^{b-1} (A_{[1:a],[1:b]})_{i,p} (B_{[1:b],[1:c]})_{p,j} + \sum_{p=1}^{1+n-b} (A_{[1:a],[b:n+1]})_{i,p} (B_{[b:n+1],[1:c]})_{p,j} = (A_{[1:a],[1:b]}B_{[1:b],[1:c]})_{i,j} + (A_{[1:a],[b:n+1]}B_{[b:n+1],[1:c]})_{i,j}$.
3. **Therefore verify that $(AB)_{[1:a],[1:c]} = A_{[1:a],[1:b]}B_{[1:b],[1:c]} + A_{[1:a],[b:n+1]}B_{[b:n+1],[1:c]}$.**
4. **Do similar computations to verify that the other three blocks of AB are computed in an analogous way to multiplying two 2×2 matrices.**

2.10 Procedure 10 (Smith normal form construction)

2.10.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . Let $A_{0,0} = 1$. The objective of the following instructions is to define the polynomials $v_1, v_2, \dots, v_{\min(m,n)}$ and transform A into a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ such that $A_{k,k} = v_k A_{k-1,k-1}$ for $1 \leq k \leq \min(m,n)$ by a sequence of operations whereby either a $\mathbb{Q}[x]$ times any of the columns is added to a different column, or a $\mathbb{Q}[x]$ times any of the rows is added to a different row.

2.10.2 Implementation

1. Apply **procedure 2** on matrix A .

2. Let $v = \langle \rangle$.
3. Let $p = \langle A_{1,1}, A_{2,2}, \dots, A_{\min(m,n), \min(m,n)} \rangle$.
4. For j going from 1 to $\min(m, n)$, do the following:
 - (a) Set $A' = A$.
 - (b) Let $\langle M, N \rangle$ receive the results of executing **procedure 4** on the pair $\langle m, n \rangle$ and the following procedure:
 - i. Apply **procedure 8** on the submatrix of A' containing rows j to m and columns j to n , and let $\langle u \rangle$ receive.
 - (c) Verify that $A'_{k,k} = u_{k+1-j} A'_{j,j}$ for $k = j$ to $k = \min(m, n)$.
 - (d) **Verify that A' is the same as A modulo the submatrix spanning rows j to m and columns j to n .**
 - (e) Verify that M_i is the same as I_m modulo the submatrix spanning rows j to m and columns j to m , for $i = 1$ to $|M|$.
 - (f) Therefore verify that M_* is the same as I_m modulo the submatrix spanning rows j to m and columns j to m .
 - (g) Verify that N_i is the same as I_n modulo the submatrix spanning rows j to n and columns j to n , for $i = 1$ to $|N|$.
 - (h) Therefore verify that N_* is the same as I_n modulo the submatrix spanning rows j to n and columns j to n .
 - (i) Verify that $A' = M_* A N_*$.
 - (j) Let $v_j = \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j} (N_*)_{r,j}$.
 - (k) Hence using (f), (h), and (i), verify that
$$\begin{aligned} A'_{j,j} &= (M_* A N_*)_{j,j} \\ &= \sum_{r=1}^m (M_*)_{j,r} (A N_*)_{r,j} \\ &= \sum_{r=1}^{\min(m,n)} (M_*)_{j,r} (A N_*)_{r,j} \\ &= \sum_{r=1}^{\min(m,n)} (M_*)_{j,r} A_{r,r} (N_*)_{r,j} \\ &= \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} A_{r,r} (N_*)_{r,j} \\ &= \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} A_{j-1,j-1} p_{r+1-j} (N_*)_{r,j} \\ &= A_{j-1,j-1} \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j} (N_*)_{r,j} \\ &= A'_{j-1,j-1} \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j} (N_*)_{r,j} \\ &= A'_{j-1,j-1} v_j. \end{aligned}$$
 - (l) Set A to A' .
 - (m) Set p to $u_{2:|u|}$.

5. Yield the tuple $\langle v \rangle$.

2.11 Procedure 11 (Determinant calculation)

2.11.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A . The objective of the following instructions is to define the $\mathbb{Q}[x] \det(A)$.

2.11.2 Implementation

1. If m equals 0, then do the following:
 - (a) **Yield the tuple $\langle 1 \rangle$.**
2. Otherwise, do the following:
 - (a) Let a be the sum of m terms where, counting from $i = 0$, the i^{th} term is $((-1)^i A_{i,1}$ times the result of applying **procedure 11** on the submatrix formed by removing the first column and i^{th} row from A).
 - (b) **Yield the tuple $\langle a \rangle$.**

We will use the notation $\det(A)$ to refer to the invocation of **procedure 11** on A .

2.12 Procedure 12 (Multilinearity verification)

2.12.1 Objective

Choose a $\mathbb{Q}[x] p$. Choose two $\mathcal{M}_{m,1}(\mathbb{Q}[x])$ s, B and C . Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A , such that its i^{th} column is $B + pC$. Let A' be A but with the i^{th} column replaced by B and let A''' be A but with the i^{th} column replaced by C . The objective of the following instructions is to show that $\det(A) = \det(A') + p \det(A''')$.

2.12.2 Implementation

1. Considering every element of A to be a unit, verify that fully expanding out $\det(A)$ yields an alternating sum of $m!$ terms, where each term is the product of m entries of A , where each entry has a distinct row and distinct column.
2. Distribute out the entries of the i^{th} column occurring in this alternating sum.

3. Verify that the outcome of (2) is $m! * 2$ terms.
4. Reorder the terms so that the currently odd ones come first and the currently even ones come last.
5. Verify that $\det(A) = \det(A') + \det(A'')$ where A'' is A but with the i^{th} column replaced by pC .
6. Reorder the factors of each term in $\det(A'')$ to bring p to the front.
7. Now verify that the $\det(A'') = p \det(A''')$.
8. **Therefore verify that** $\det(A) = \det(A') + p \det(A''')$.

Make an analogous procedure for cases when a given row is the sum of two $1 \times m$ matrices.

2.13 Procedure 13 (Alternation verification)

2.13.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A . Choose a row $1 < i \leq m$. Let A' be A with rows $i-1$ and i swapped. The objective of the following instructions is to show that $\det(A') = -\det(A)$.

2.13.2 Implementation

1. Fully expand out $\det A$ into $m!$ terms and then do the same for $\det A'$.
2. For each of the $m!$ ways to select m rows from A , let $r = (r_1, r_2, \dots, r_m)$ be the rows selected corresponding to the columns $1, 2, \dots, m$ respectively, and do the following:
 - (a) Verify that the values selected by r in A are the same as the values selected by r' in A' , where r' is obtained by swapping the values $i-1$ and i in the sequence r .
 - (b) Execute **procedure 11** on A , and consider the execution path that produces the term corresponding to the row selections r . Ditto for A' and r' .
 - (c) Let k be the lesser of the indices of the values $i-1$ and i in the sequence r .
 - (d) Verify that the signs attached to $A_{r_1,1}, \dots, A_{r_{k-1},k-1}$ are the same as the signs attached to $A'_{r'_1,1}, \dots, A'_{r'_{k-1},k-1}$.

- (e) Verify that indices r_k and r'_k identify adjacent rows in the remaining respective submatrices of A and A' .
- (f) Therefore verify that the signs then attached to A_{r_k} and $A'_{r'_k}$ are opposite.
- (g) Verify that after the removal of r_k and r'_k from their respective submatrices, the submatrices left are identical.
- (h) Therefore verify that the signs attached to $A_{r_{k+1},k+1}, \dots, A_{r_{m-1},m-1}$ are the same as the signs attached to $A'_{r'_{k+1},k+1}, \dots, A'_{r'_{m-1},m-1}$.
- (i) Therefore verify that the term corresponding to the row selections r' in the full expansion of $\det(A')$ has the opposite sign to the term corresponding to the row selections r in the full expansion of $\det(A)$.

3. Therefore verify that every term in the full expansion of $\det(A)$ corresponds to a unique negated version of itself in the full expansion of $\det(A')$.

4. **Therefore verify that** $\det(A') = -\det(A)$.

Make a simpler procedure to verify that column swaps cause sign alternations.

2.14 Procedure 14

2.14.1 Objective

Choose integers $1 < i \leq m$. Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A , such that columns $i-1$ and i are the same. The objective of the following instructions is to show that either $1 = -1$ or $\det(A) = 0$.

2.14.2 Implementation

1. If $\det(A) \neq 0$, then do the following:
 - (a) Let A' be A with columns i and $i-1$ swapped.
 - (b) Verify that A' equals A .
 - (c) Therefore verify that $\det(A') = \det(A)$.
 - (d) Using **procedure 13**, also verify that $\det(A') = -\det(A)$.

(e) Therefore verify that $\det(A) = -\det(A)$.

(f) Therefore verify that $1 = -1$.

(g) **Abort procedure.**

2. Otherwise, do the following:

(a) **Verify that** $\det(A) = 0$.

Make an analogous procedure to verify that matrix choices with repeated rows yield determinants equal to zero.

2.15 Procedure 15

2.15.1 Objective

Choose integers $1 \leq i \leq m$. Choose an integer $0 < j \leq m - i$. Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A . Let A' be A but with column i moved j places. The objective of the following instructions is to show that $\det(A') = (-1)^j \det(A)$.

2.15.2 Implementation

1. Let $A_i = A$.

2. For $k = i + 1$ to $k = i + j$, do the following:

(a) Let A_k be obtained by swapping columns $k - 1$ and k of A_{k-1} .

(b) Using **procedure 13**, verify that $\det(A_k) = -\det(A_{k-1})$.

3. Verify that $A' = A_{i+j}$.

4. **Therefore verify that** $\det(A') = \det(A_{i+j}) = (-1)^1 \det(A_{i+j-1}) = \dots = (-1)^j \det(A_i) = (-1)^j \det(A)$.

Make an analogous procedure that verifies that $\det(A') = (-1)^j \det(A)$ when a non-positive integer, j , is chosen.

Also make an analogous procedure that does the verification for moved rows.

2.16 Procedure 16 (Compound matrix calculation)

2.16.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A , and choose an integer $0 \leq k \leq \min(m, n)$. The objective of the following instructions is to define the $\mathcal{M}_{\binom{m}{k}, \binom{n}{k}}(\mathbb{Q}[x])$ $C_k(A)$.

2.16.2 Implementation

1. Yield a tuple comprising the $\binom{m}{k} \times \binom{n}{k}$ matrix constructed as follows:

(a) The rows are labeled by the colexicographically sorted list of increasing length- k sequences whose elements are picked from the first m positive integers.

(b) The columns are labeled by the colexicographically sorted list of increasing length- k sequences whose elements are picked from the first n positive integers.

(c) For each row label I : For each column label J : Let the entry at position (I, J) be $\det(A_{I,J})$.

We will use the notation $C_k(A)$ to refer to an invocation of **procedure 16 on the matrix A .**

We will use the notation $A_{I,J}$ to refer to the entry of A with row label I and column label J .

2.17 Procedure 17 (Compound matrix of identity calculation)

2.17.1 Objective

Choose two integers $0 \leq k \leq m$. The objective of the following instructions is to show that $C_k(I_m) = I_{\binom{m}{k}}$.

2.17.2 Implementation

1. For each row label I of $C_k(I_m)$, for each column label J of $C_k(I_m)$, do the following:

(a) If the $I = J$, then do the following:

- i. Verify that $((I_m)_{I,J})_{i,j} = ((I_m)_{J,J})_{i,j} = (I_m)_{J_i,J_j} = [J_i = J_j] = [i = j]$ for $1 \leq i \leq k$, for $1 \leq j \leq k$.
 - ii. Therefore verify that $(C_k(I_m))_{\underline{I},\underline{J}} = I_k$.
 - iii. **Therefore using procedure 11, verify that $(C_k(I_m))_{\underline{I},\underline{J}} = \det((I_m)_{I,J}) = \det(I_k) = 1$.**
- (b) Otherwise, do the following:
- i. Verify that $I \neq J$.
 - ii. Let i be the index of an element of I that is not an element of J .
 - iii. Now verify that $(I_m)_{I_i,j} = [I_i = j] = 0$, for each j in J .
 - iv. Therefore verify that $((I_m)_{I,J})_{i,*} = 0_{1 \times k}$.
 - v. **Therefore using procedure 11, verify that $(C_k(I_m))_{\underline{I},\underline{J}} = \det((I_m)_{I,J}) = 0$.**
2. **Therefore verify that $C_k(I_m) = I_{\binom{m}{k}}$.**

2.18 Procedure 18

2.18.1 Objective

Choose an integer $1 \leq k \leq \min(m, n)$. Choose a $\mathcal{T}_m(\mathbb{Q}[x])$, A , such that the off diagonal entry is the $\mathbb{Q}[x]$ p at (i, j) . Also choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, B . The objective of the following instructions is to construct a $\mathcal{M}_{\binom{m}{k}, \binom{m}{k}}(\mathbb{Q}[x])$ D such that $C_k(AB) = DC_k(B)$.

2.18.2 Implementation

1. Let $D = C_k(I_m) = I_{\binom{m}{k}}$.
2. Verify that AB equals B , but with its row i having p times B 's row j added to it.
3. Go through the row labels, I , of $C_k(AB)$ and do the following:
 - (a) If $i \notin I$, then do the following:
 - i. Verify that $(AB)_{I,[1:n+1]} = B_{I,[1:n+1]}$.

- ii. Therefore for each column label J , verify that $C_k(AB)_{\underline{I},\underline{J}} = \det((AB)_{I,J}) = \det(B_{I,J}) = C_k(B)_{\underline{I},\underline{J}}$.

- iii. **Therefore verify that $(C_k(AB))_{\underline{I},*} = (C_k(B))_{\underline{I},*}$.**

(b) Otherwise, if $i \in I$, then:

- i. Let I' be I but with an in-place replacement of i by j .
- ii. For each column label J : Using **procedure 12**, verify that $C_k(AB)_{\underline{I},\underline{J}} = \det((AB)_{I,J}) = \det(B_{I,J}) + p * \det(B_{I',J})$.
- iii. If $j \in I$, then do the following:

- A. Verify that the sequence I' contains two j s.
- B. For each column label J : Using **procedure 14** verify that $\det(B_{I',J}) = 0$.
- C. Therefore for each column label J : verify that $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) = C_k(B)_{\underline{I},\underline{J}}$.
- D. **Therefore verify that $C_k(AB)_{\underline{I},*} = C_k(B)_{\underline{I},*}$.**

iv. Otherwise if $j \notin I$, do the following:

- A. Let l be the signed number of places that the j introduced above needs to be moved in order to make I' an increasing sequence.
- B. Let I'' be obtained from I' by moving the integer j in I' by l places.
- C. For each column label J : Using **procedure 15**, verify that $\det(B_{I',J}) = (-1)^l \det(B_{I'',J})$.
- D. Therefore for each column label J : Verify that $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) + p * \det(B_{I',J}) = \det(B_{I,J}) + (-1)^l p * \det(B_{I'',J})$.
- E. Verify that I'' is a row label of $C_k(B)$.
- F. Therefore for each column label J : Verify that $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) + (-1)^l p * \det(B_{I'',J}) = C_k(B)_{\underline{I},\underline{J}} + (-1)^l p * C_k(B)_{\underline{I}'',\underline{J}}$.

G. **Therefore verify that**
 $(C_k(AB))_{\underline{I},*} = (C_k(B))_{\underline{I},*} + (-1)^l p(C_k(B))_{\underline{I}'',*}.$

H. **Set $D_{\underline{I},\underline{I}''}$ to $(-1)^l p$.**

(c) **Therefore verify that** $C_k(AB)_{\underline{I},*} = D_{\underline{I},*} C_k(B).$

4. **Therefore verify that** $C_k(AB) = DC_k(B).$

2.19 Procedure 19

2.19.1 Objective

Choose a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$, A . Also choose an $\mathcal{M}_{n,n}(\mathbb{Q}[x])$, B . Also choose an integer $0 \leq k \leq \min(m, n)$. The objective of the following instructions is to construct a $\mathcal{D}_{\binom{m}{k}, \binom{n}{k}}(\mathbb{Q}[x])$ D such that $C_k(AB) = DC_k(B)$.

2.19.2 Implementation

1. Let $D = C_k(0_{m \times n}) = 0_{\binom{m}{k} \times \binom{n}{k}}$.
2. Verify that AB equals $B_{[1:\min(m,n)+1], [1:n+1]}$ with each row i multiplied by $A_{i,i}$.
3. Go through the row labels, I , of $C_k(AB)$ and do the following:
 - (a) If $I_k \leq \min(m, n)$, then do the following:
 - i. Using **procedure 16**, verify that every element of I is less than or equal to $\min(m, n)$.
 - ii. Let $A_0 = A$.
 - iii. For $i = 1$ to $i = k$: Let A_i equal A_{i-1} but with position (I_i, I_i) set to 1.
 - iv. For each column label J : Repeatedly using **procedure 12**, verify that $C_k(AB)_{I,J} = \det((AB)_{I,J}) = \det((A_0 B)_{I,J}) = A_{I_1, I_1} \det((A_1 B)_{I,J}) = A_{I_1, I_1} A_{I_2, I_2} \det((A_2 B)_{I,J}) = \dots = A_{I_1, I_1} A_{I_2, I_2} \dots A_{I_k, I_k} \det((A_k B)_{I,J}) = A_{I_1, I_1} A_{I_2, I_2} \dots A_{I_k, I_k} \det(B_{I,J}) = A_{I_1, I_1} A_{I_2, I_2} \dots A_{I_k, I_k} C_k(B)_{I,J}.$
 - v. **Therefore verify that** $(C_k(AB))_{\underline{I},*} = A_{I_1, I_1} A_{I_2, I_2} \dots A_{I_k, I_k} * (C_k(B))_{\underline{I},*}.$

vi. **Set $D_{\underline{I},\underline{I}}$ to $A_{I_1, I_1} A_{I_2, I_2} \dots A_{I_k, I_k}$.**

(b) Otherwise if $I_k > \min(m, n)$, then do the following:

- i. Verify that $A_{I_k, *} = 0_{1 \times n}$.
- ii. Therefore verify that $(AB)_{I_k, *} = 0_{1 \times n}$.
- iii. Therefore verify that $((AB)_{I,*})_{k,*} = 0_{1 \times n}$.
- iv. Therefore using **procedure 11**, for each column label J : verify that $C_k(AB)_{I,J} = \det((AB)_{I,J}) = 0$.
- v. **Therefore verify that $(C_k(AB))_{\underline{I},*}$ is zero.**

(c) **Therefore verify that** $C_k(AB)_{\underline{I},*} = D_{\underline{I},*} C_k(B).$

4. **Verify that D is diagonal.**

5. **Verify that $C_k(AB) = DC_k(B)$.**

2.20 Procedure 20

2.20.1 Objective

Choose an integer $1 \leq k \leq \min(m, n)$. Choose a $\mathcal{T}_m(\mathbb{Q}[x])$, A , such that the off diagonal entry is the $\mathbb{Q}[x]$ p at (i, j) . Also choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, B . The objective of the following instructions is to show that $C_k(AB) = C_k(A)C_k(B)$.

2.20.2 Implementation

1. Execute **procedure 18** on matrices A and I_m . Let D be the matrix constructed.
2. Using **procedure 17**, verify that $C_k(A) = C_k(AI_m) = DC_k(I_m) = DI_{\binom{m}{k}} = D$.
3. Execute **procedure 18** on matrices A and B . Let D' be the matrix constructed.
4. Verify that $C_k(AB) = D' C_k(B)$.
5. Verify that $D' = D = C_k(A)$.
6. **Therefore verify that** $C_k(AB) = C_k(A)C_k(B).$

Make an analogous procedure to show that $C_k(BA) = C_k(B)C_k(A)$.

Using **procedure 19**, make a procedure similar to the above but that only instead allows for a diagonal matrix of $\mathbb{Q}[x]$ s, A , to be chosen.

2.21 Procedure 21

2.21.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . Let $D_{0,0} = 1$. The objective of the following instructions is to construct a list of $\mathcal{T}_m(\mathbb{Q}[x])$ s, M , a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$, D , a list of $\mathbb{Q}[x]$ s, v , and a list of $\mathcal{T}_n(\mathbb{Q}[x])$ s, N , such that $MAN = D$, $A = M^{-1}DN^{-1}$, and $D_{i,i} = v_i D_{i-1,i-1}$ for $i = 1$ to $i = \min(m, n)$.

2.21.2 Implementation

1. Let D be a copy of A .
2. Let $\langle M, N \rangle$ receive the results of executing **procedure 4** on the pair $\langle m, n \rangle$ and the following procedure:
 - (a) Execute **procedure 10** on the matrix D and let $\langle v \rangle$ receive.
3. Verify that $D_{i,i} = v_i D_{i-1,i-1}$ for $i = 1$ to $i = \min(m, n)$.
4. Verify that $M_* AN_* = D$.
5. Hence verify that $A = I_m A I_n = M^{-1} M_* AN_* N^{-1} = M^{-1} D N^{-1}$.
6. Yield the tuple $\langle M, D, v, N \rangle$.

2.22 Procedure 22 (Compound matrix of matrix product calculation)

2.22.1 Objective

Choose integers $0 \leq k \leq \min(m, n, p)$. Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . Also choose a $\mathcal{M}_{n,p}(\mathbb{Q}[x])$, B . The objective of the following instructions is to show that $C_k(AB) = C_k(A)C_k(B)$.

2.22.2 Implementation

1. Execute **procedure 21** on A and let $\langle M, D, , N \rangle$ receive.

2. Using repeated applications of **procedure 20**, verify that $C_k(AB) = C_k(M^{-1}_1 \cdots M^{-1}_{|M|} D N^{-1}_1 \cdots N^{-1}_{|N|} B) = C_k(M^{-1}_1) \cdots C_k(M^{-1}_{|M|}) * C_k(D) * C_k(N^{-1}_1) \cdots C_k(N^{-1}_{|N|}) C_k(B) = C_k(M^{-1}_1 \cdots M^{-1}_{|M|} D N^{-1}_1 \cdots N^{-1}_{|N|}) C_k(B) = C_k(A) C_k(B)$.

2.23 Procedure 23 (Determinant equals product of diagonal entries verification)

2.23.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A . Let D be a copy of A . Execute **procedure 2** on D . The objective of the following instructions is to show that $\det(A)$ is the product of the diagonal entries of D .

2.23.2 Implementation

1. Execute **procedure 21** on A and let $\langle M, D, , N \rangle$ receive.
2. Using **procedure 11** and **procedure 22**, verify that $\det(A) = C_m(A) = C_m(M^{-1}_1 \cdots M^{-1}_{|M|} D N^{-1}_1 \cdots N^{-1}_{|N|}) = C_m(M^{-1}_1) \cdots C_m(M^{-1}_{|M|}) C_m(D) C_m(N^{-1}_1) \cdots C_m(N^{-1}_{|N|}) = 1 \cdots 1 C_m(D) 1 \cdots 1 = C_m(D) = \det(D)$.
3. Using **procedure 11**, verify that $\det(D)$ is the product of the diagonal entries of D .

2.24 Procedure 24 (Transpose calculation)

2.24.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . The objective of the following instructions is to define the $\mathcal{M}_{n,m}(\mathbb{Q}[x])$ A^T .

2.24.2 Implementation

1. Make an $n \times m$ matrix, A^T .
2. For $i = 1$ to $i = n$:
 - (a) For $j = 1$ to $j = m$:

i. Let $A^T_{i,j} = A_{j,i}$.

3. Yield the tuple $\langle A^T \rangle$.

The notation A^T shall be used to refer to the result of invoking **procedure 24** on a matrix A .

2.25 Procedure 25 (Transpose of product verification)

2.25.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A , and a $\mathcal{M}_{n,k}(\mathbb{Q}[x])$, B . The objective of the following instructions is to show that $B^T A^T = (AB)^T$.

2.25.2 Implementation

1. Verify that $B^T A^T$ and $(AB)^T$ have dimensions $k \times m$.
2. For $i = 1$ to $i = k$:
 - (a) For $j = 1$ to $j = m$:
 - i. Using **procedure 24**, verify that

$$(B^T A^T)_{i,j} = \sum_{l=0}^n B_{l,i} A_{j,l} = \sum_{l=0}^n A_{j,l} B_{l,i} = (AB)_{j,i} = ((AB)^T)_{i,j}.$$
3. Therefore verify that $B^T A^T = (AB)^T$.

2.26 Procedure 26 (Determinant of transpose verification)

2.26.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, A . The objective of the following instructions is to show that $\det(A^T) = \det(A)$.

2.26.2 Implementation

1. Execute **procedure 21** on A and let $\langle M, D, N \rangle$ receive.
2. Therefore using **procedures 19 and 20**, verify that

$$\begin{aligned} \det(A^T) &= \det((M^{-1}_1 \cdots M^{-1}_{|M|} D N^{-1}_1 \cdots N^{-1}_{|N|})^T) = \\ \det((N^{-1}_{|N|})^T \cdots (N^{-1}_1)^T D^T (M^{-1}_{|M|})^T \cdots (M^{-1}_1)^T) &= \\ \det(D^T) &= \det(D) = \\ \det(M^{-1}_1 \cdots M^{-1}_{|M|} D N^{-1}_1 \cdots N^{-1}_{|N|}) &= \\ \det(A). \end{aligned}$$

2.27 Procedure 27 (Compound matrix of transpose verification)

2.27.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A , and an integer $0 \leq k \leq \min(m, n)$. The objective of the following instructions is to show that $(C_k(A))^T = (C_k(A^T))$.

2.27.2 Implementation

1. For each row label I of $C_k(A^T)$, do the following:
 - (a) For each column label J of $C_k(A^T)$, do the following:
 - i. Using **procedure 26**, verify that

$$(C_k(A^T))_{I,J} = \det((A^T)_{I,J}) = \det(A_{J,I}) = (C_k(A))_{J,I}.$$
2. Therefore verify that $(C_k(A))^T = (C_k(A^T))$.

2.28 Procedure 28 (Linear system solution construction)

2.28.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q})$, A , and a $\mathcal{M}_{m,p}(\mathbb{Q})$, B . Execute **procedure 21** on A and let $\langle M, D, N \rangle$ receive the result. If the indices of the rows of D that are entirely zero are also the indices of the rows of MB that are entirely zero, then the objective of the following instructions is to construct a $\mathcal{M}_{n,p}(\mathbb{Q})$ E such that $AE = B$.

2.28.2 Implementation

1. Verify that $A = M^{-1} D N^{-1}$.
2. Verify that M^{-1} , D , and N^{-1} are $\mathcal{M}_{*,*}(\mathbb{Q})$ s.
3. Let C be an $n \times p$ matrix with its i^{th} row given as follows:
 - (a) If $D_{i,i} \neq 0$, then do the following:
 - i. Let row i be row i of MB divided by $D_{i,i}$.
 - (b) Otherwise, do the following:
 - i. Choose p rational numbers to fill up the row.

4. Verify that $DC = MB$.
5. Let E be NC .
6. Therefore using **procedure 6**, verify that $AE = M^{-1}DN^{-1}E = M^{-1}DN^{-1}NC = M^{-1}DI_nC = M^{-1}DC = M^{-1}MB = I_mB = B$.
7. Yield the tuple $\langle E \rangle$.

The notation $A \setminus B$ shall be used to refer to the result, E , of invoking **procedure 28** on matrices A and B .

Make an analogous procedure to yield an F such that $FA = B$. The notation B/A shall be used to refer to the F yielded by invoking this procedure.

2.29 Procedure 29

2.29.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q})$, A , a $\mathcal{M}_{n,p}(\mathbb{Q})$, E , and a $\mathcal{M}_{m,p}(\mathbb{Q})$, B such that $AE = B$. Execute **procedure 21** on A and let $\langle M, D, , N \rangle$ receive the result. If the indices of the rows of D that are entirely zero are not also the indices of the rows of M_*B that are entirely zero, then the objective of the following instructions is to show that $0 \neq 0$.

2.29.2 Implementation

1. Verify that $M^{-1}_*DN^{-1}_*E = AE = B$.
2. Therefore verify that $DN^{-1}_*E = M_*B$.
3. Let i be an integer such that $D_{i,*}$ is zero and yet $(M_*B)_{i,*}$ is not zero.
4. Verify that $D_{i,*} = D_{i,*}N^{-1}_*E = (DN^{-1}_*E)_{i,*} = (M_*B)_{i,*}$.
5. Let j be an integer such that $(M_*B)_{i,j} \neq 0$.
6. Now verify that $0 = D_{i,j} = (M_*B)_{i,j} \neq 0$.

2.30 Procedure 30

2.30.1 Objective

Choose two $\mathcal{M}_{m,m}(\mathbb{Q})$ s, A and B , such that $AB = I_m$. The objective of the following instructions is to

show that either $0 = 1$ or $BA = I_m$.

2.30.2 Implementation

1. Execute **procedure 5** on B and let $\langle M^{-1}, D, N^{-1} \rangle$ receive the result.
2. Verify that $B = M^{-1}_*DN^{-1}_*$.
3. If D has a zero on its diagonal, then do the following:
 - (a) Using **procedure 23**, verify that $\det(I_m) = \det(AB) = \det(A)\det(B) = \det(A)\det(D) = \det(A) * 0 = 0$.
 - (b) Using **procedure 11**, verify that $\det(I_m) = 1^m = 1$.
 - (c) Verify that $0 = 1$.
 - (d) **Abort procedure.**
4. Otherwise do the following:
 - (a) Verify that D does not have a zero on its diagonal.
 - (b) Verify that $B \setminus I_m = I_m(B \setminus I_m) = AB(B \setminus I_m) = A(B(B \setminus I_m)) = AI_m = A$.
 - (c) **Therefore verify that $BA = B(B \setminus I_m) = I_m$.**

2.31 Procedure 31

2.31.1 Objective

Choose an $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, M , and an $\mathcal{M}_{m,m}(\mathbb{Q})$, B . The objective of the following instructions is to construct a $\mathcal{M}_{m,m}(\mathbb{Q}[x])$, Q , and a $\mathcal{M}_{m,m}(\mathbb{Q})$, R , such that $M = (xI_m - B)Q + R$.

2.31.2 Implementation

1. Let $M_0x^b + M_1x^{b-1} + \dots + M_bx^0 = M$, where the M_i are $\mathcal{M}_{m,m}(\mathbb{Q})$ s.
2. Now let $R = B^bM_0 + B^{b-1}M_1 + \dots + B^0M_b$.
3. Let $Q = \sum_{k=1}^b (x^{k-1}I_mB^0 + x^{k-2}I_mB^1 + \dots + x^0I_mB^{k-1})M_k$.
4. Verify that $M - R = (xI_m - B) \sum_{k=1}^b (x^{k-1}I_mB^0 + x^{k-2}I_mB^1 + \dots + x^0I_mB^{k-1})M_k = (xI_m - B)Q$.

5. Verify that $M = (xI_m - B)Q + R$.
6. Yield the tuple $\langle Q, R \rangle$.

Make an analogous procedure that instead has the objective of constructing a Q and R such that $M = Q(xI_m - B) + R$.

2.32 Procedure 32

2.32.1 Objective

Choose two $\mathcal{M}_{m,m}(\mathbb{Q})$ s, B, A , and two lists of $\mathcal{T}_m(\mathbb{Q}[x])$ s such that $xI_m - B = M(xI_m - A)N$. The objective of the following instructions is to construct $\mathcal{M}_{m,m}(\mathbb{Q})$ s R_1 and R_3 such that $I_m = R_1R_3$ and $B = R_1AR_3$.

2.32.2 Implementation

1. Verify that $(xI_m - B)N^{-1} = M(xI_m - A)NN^{-1} = M(xI_m - A)I_m = M(xI_m - A)$.
2. Execute **procedure 31** on $\langle M, B \rangle$ and let $\langle Q_1, R_1 \rangle$ receive.
3. Verify that $M = (xI_m - B)Q_1 + R_1$.
4. Execute **procedure 31** on $\langle N^{-1}, A \rangle$ and let $\langle Q_2, R_2 \rangle$ receive.
5. Verify that $N^{-1} = Q_2(xI_m - A) + R_2$.
6. By substituting M and N^{-1} into (2), verify that $(xI_m - B)(Q_2(xI_m - A) + R_2) = ((xI_m - B)Q_1 + R_1)(xI_m - A)$.
7. By rearranging both sides, verify that $(xI_m - B)(Q_2 - Q_1)(xI_m - A) = R_1(xI_m - A) - (xI_m - B)R_2$.
8. By equating the coefficients of different powers of x both sides, verify that $Q_2 - Q_1 = 0_{m \times m}$.
9. Verify that $R_1(xI_m - A) - (xI_m - B)R_2 = (xI_m - B)(Q_2 - Q_1)(xI_m - A) = (xI_m - B)0_{m \times m}(xI_m - A) = 0_{m \times m}$.
10. Therefore by adding $(xI_m - B)R_2$ to both sides, verify that $xR_1 - R_1A = R_1(xI_m - A) = (xI_m - B)R_2 = xR_2 - BR_2$.
11. By equating the coefficients of x on both sides, verify that $R_1 = R_2$.
12. Therefore verify that $R_1A = BR_1$.

13. Execute **procedure 31** on $\langle M^{-1}, A \rangle$ and let $\langle Q_3, R_3 \rangle$ receive.
14. Verify that $M^{-1} = (xI_m - A)Q_3 + R_3$.
15. Verify that $I_m = MM^{-1} = ((xI_m - B)Q_1 + R_1)M^{-1} = (xI_m - B)Q_1M^{-1} + R_1M^{-1} = (xI_m - B)Q_1M^{-1} + R_1(xI_m - A)Q_3 + R_1R_3 = (xI_m - B)Q_1M^{-1} + (xI_m - B)R_1Q_3 + R_1R_3 = (xI_m - B)(Q_1M^{-1} + R_1Q_3) + R_1R_3$.
16. By equating the powers of x on both sides, verify that $Q_1M^{-1} + R_1Q_3 = 0$.
17. By substituting zero for $Q_1M^{-1} + R_1Q_3$, **verify that** $I_m = (xI_m - B)0_{m \times m} + R_1R_3 = R_1R_3$.
18. **Therefore using procedure 30, verify that** $R_3R_1 = I_m$.
19. **Also, verify that** $B = BI_m = BR_1R_3 = R_1AR_3$.
20. **Yield the pair** (R_1, R_3) .

2.33 Procedure 33

2.33.1 Objective

Choose a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A . Choose two integers $1 \leq i, j \leq m$ such that $i \neq j$. The objective of the following instructions is to negate row i and swap it with row j using only elementary row and column operations.

2.33.2 Implementation

1. Let A be our working matrix.
2. Subtract row j from row i .
3. Add row i to row j .
4. Subtract row j from row i .
5. **Verify that the i^{th} row has been negated and swapped with the j^{th} row.**

Make an analogous procedure to negate column i and swap it with column j .

2.34 Procedure 34

2.34.1 Objective

Choose a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$, A . Choose two integers $1 \leq i, j \leq \min(m, n)$ such that $i \neq j$. The objective of the following instructions is to swap $B_{i,i}$ and $B_{j,j}$ using only elementary row and column operations.

2.34.2 Implementation

1. Let A be our working matrix.
2. Use **procedure 33** to negate the i^{th} row and swap it with the j^{th} row.
3. Use **procedure 33** to negate the i^{th} column and swap it with the j^{th} column.
4. **Therefore, overall verify that $B_{i,i}$ and $B_{j,j}$ have been swapped.**

2.35 Procedure 35

2.35.1 Objective

Choose a $\mathcal{D}_{m,n}(\mathbb{Q}[x])$, A . Choose two integers $1 \leq i, j \leq \min(m, n)$ such that $i \neq j$. Choose a rational $k \neq 0$. The objective of the following instructions is to multiply $B_{i,i}$ by k and $B_{j,j}$ by $\frac{1}{k}$ using only elementary row and column operations.

2.35.2 Implementation

1. Let A be our working matrix.
2. Add k times row i to row j .
3. Subtract $\frac{1}{k}$ times row j from row i .
4. Add k times row i to row j .
5. Verify that the i^{th} row has been scaled by k , the j^{th} row by $-\frac{1}{k}$, and that both these rows are swapped.
6. Use **procedure 33** to negate the i^{th} row and swap it with the j^{th} row.
7. **Therefore, overall verify that $B_{i,i}$ has been multiplied by k , and $B_{j,j}$ by $\frac{1}{k}$.**

2.36 Procedure 36

2.36.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute **procedure 10** on the polynomial matrix $xI - A$ and let $\langle B \rangle$ be the result. The objective of the following instructions is to show that either none of the diagonal entries of B are equal to zero, or $1 = 0$.

2.36.2 Implementation

1. Using **procedure 11**, verify that $\det(xI - A)$ is a monic polynomial of degree m .
2. Therefore verify that $\det(B) = \det(xI - A)$ is a monic polynomial of degree m .
3. If any of the diagonal entries of B equal zero, then do the following:
 - (a) Using **procedure 11**, verify that $\det(B) = B_{1,1}B_{2,2} \cdots B_{m,m} = 0$.
 - (b) Therefore verify that $1 = 0$.
 - (c) **Abort procedure.**
4. Otherwise do the following:
 - (a) **Verify that none of the diagonal entries of B equal zero.**

Let us use the notation $[P]$ as a shorthand for "if P , then yield 1, otherwise yield 0" in what follows.

2.37 Procedure 37 (Block diagonal construction)

2.37.1 Objective

Choose a list of $\mathcal{M}_{*,*}(\mathbb{Q})$, C . Let $m = \sum_{i=1}^{|C|} \dim(C_i)$. The objective of the following instructions is to define the $\mathcal{M}_{m,m}(\mathbb{Q})$, $\text{bdiag}(C)$.

2.37.2 Implementation

1. Let E be a 0×0 matrices.
2. **Now for $i = 1$ to $i = |C|$:**
 - (a) Add $\dim(C_i)$ columns filled with zeros to the right end of E .

- (b) Add $\dim(C_i)$ rows filled with zeros to the bottom end of E .
- (c) Set the bottom-right corner of E equal to C_i .
- 3. Verify that $\dim(E) = \sum_{i=1}^{|C|} \dim(C_i) = m$.
- 4. Yield the tuple $\langle E \rangle$.

2.38 Procedure 38

2.38.1 Objective

Choose a positive integer m and an $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute **procedure 21** on the polynomial matrix $xI_m - A$ and let $\langle B, v, \rangle$ be the result. The objective of the following instructions is to either show that $0 < 0$ or to construct an integer a such that $\sum_{i=a}^m \deg(B_{i,i}) = m$, $\deg(B_{i,i}) > 0$ for $i = a$ to $i = m$, and $\deg(B_{i,i}) = 0$ for $i = 1$ to $i = a - 1$.

2.38.2 Implementation

1. Execute **procedure 36** on A .
2. If $\deg(B_{i,i}) = 0$ for $i = 1$ to $i = m$, then do the following:
 - (a) Verify that $\det(xI_m - A) = \det(B) = B_{1,1}B_{2,2} \cdots B_{m,m}$.
 - (b) Therefore verify that $0 < m = \deg(\det(xI_m - A)) = \deg(B_{1,1}B_{2,2} \cdots B_{m,m}) = 0 + 0 + \cdots + 0 = 0$.
 - (c) **Abort procedure.**
3. Otherwise do the following:
 - (a) Let $1 \leq a \leq m$ be the least integer such that $\deg(B_{a,a}) > 0$.
 - (b) **Verify that** $\deg(B_{i,i}) = 0$ **for** $i = 1$ **to** $i = a - 1$.
 - (c) **Verify that** $\sum_{i=a}^m \deg(B_{i,i}) = \sum_{i=1}^m \deg(B_{i,i}) = \deg(B_{1,1}B_{2,2} \cdots B_{m,m}) = \deg(\det(B)) = \deg(xI_m - A) = m$.
 - (d) For $i = a + 1$ to $i = m$, do the following:
 - i. Verify that $B_{i,i} = u_i B_{i-1,i-1}$.
 - ii. Verify that $B_{i,i} \neq 0$.
 - iii. Therefore verify that $u_i \neq 0$.
 - iv. **Therefore verify that** $\deg(B_{i,i}) = \deg(u_i B_{i-1,i-1}) \geq \deg(B_{i-1,i-1}) > 0$.
 - (e) **Yield the tuple** $\langle a \rangle$.

2.39 Procedure 39 (Rational canonical form construction)

2.39.1 Objective

Choose a $\mathbb{Q}[x]$, $p = x^k + p_1x^{k-1} + p_2x^{k-2} + \cdots + p_kx^0$ such that $k > 0$. The objective of the following instructions is to define the $\mathcal{M}_{k,k}(\mathbb{Q})$, $\text{rcan}(p)$.

2.39.2 Implementation

1. Make a $k \times k$ matrix C .
2. Let C 's first $k - 1$ columns be filled with the last $k - 1$ columns of I_k .
3. Let C 's last column from top to bottom be $-p_k, -p_{k-1}, \dots, -p_1$.
4. **Yield the tuple** $\langle C \rangle$.

2.40 Procedure 40

2.40.1 Objective

Choose a monic $\mathbb{Q}[x]$, p such that $\deg(p) > 0$. Let $k = \deg(p)$. Choose a $\mathcal{M}_{k,k}(\mathbb{Q}[x])$, D , such that $D = xI_k - \text{rcan}(p)$. The objective of the following instructions is to transform D into $\text{bdiag}(1, \dots, 1, p)$ by a sequence of elementary operations.

2.40.2 Implementation

1. Let the matrix D be our working matrix.
2. For $i = k$ going down to $i = 2$, add x times row i to row $i - 1$.
3. Verify that D 's first $k - 1$ columns are now the last $k - 1$ columns of $-I_k$.
4. Verify that D 's last column is p followed by some other polynomials.
5. For $i = 2$ going up to $i = k$, subtract $D_{i,k}$ times column $i - 1$ from column k .

6. Verify that D 's last column is now p followed by zeros.
7. For $i = 2$ going up to $i = k$, negate row $i - 1$ and exchange it with row i using [procedure 33](#).
8. **Therefore verify that $D = \text{bdiag}(1, \dots, 1, p)$.**

Let us use the notation $\text{mon}(p)$ as a shorthand for " $\frac{p}{x^{\deg(p)} \circ p}$ " in what follows.

2.41 Procedure 41

2.41.1 Objective

Choose a positive integer m and an $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute [procedure 4](#) on the polynomial matrix $xI_m - A$ and let $\langle B, , \rangle$ receive the result. Execute [procedure 38](#) on A and let $\langle a \rangle$ receive the result. Let $E_i = \text{rcan}(\text{mon}(B_{a-1+i, a-1+i}))$ for $i = 1$ to $i = m + 1 - a$. The objective of the following instructions is to first show that $\dim(\text{bdiag}(E)) = m$, and second to apply a sequence of elementary operations on $xI_m - \text{bdiag}(E)$ to obtain the matrix B .

2.41.2 Implementation

1. Verify that the diagonal of B comprises $x - 1$ rationals followed by $B_{a,a}, B_{a+1,a+1}, \dots, B_{m,m}$.
2. **Using [procedure 40](#), verify that**

$$\begin{aligned} \dim(\text{bdiag}(E)) &= \sum_{i=1}^{|E|} \dim(E_i) = \sum_{i=1}^{|E|} \dim(\text{rcan}(\text{mon}(B_{a-1+i, a-1+i}))) \\ &= \sum_{i=1}^{|E|} \deg(\text{mon}(B_{a-1+i, a-1+i})) = \sum_{i=1}^{m+1-a} \deg(B_{a-1+i, a-1+i}) \\ &= \sum_{i=a}^m \deg(B_{i,i}) = m. \end{aligned}$$
3. Let $F = xI_m - \text{bdiag}(E)$.
4. Now for $i = 1$ to $i = |E|$:
 - (a) Let $j = 1 + \sum_{r=1}^{i-1} \dim(E_r)$.
 - (b) Let $k = j + \dim(E_i)$.
 - (c) Apply [procedure 40](#) on the tuple $\langle \text{mon}(B_{a-1+i, a-1+i}), F_{[j:k], [j:k]} \rangle$.
5. Now verify that F is a $\mathcal{D}_{m,m}(\mathbb{Q})$.
6. Also verify that the diagonal of F comprises $\text{mon}(B_{a,a}), \text{mon}(B_{a+1,a+1}), \dots, \text{mon}(B_{m,m})$ and $a - 1$ 1s.

7. Rearrange the diagonal of F so that $\text{mon}(B_{i,i})$ is at the i^{th} position on the diagonal for $i = a$ to $i = m$ by doing pairwise swaps. In general, swap the i^{th} and j^{th} diagonal entries using [procedure 34](#).

8. For $i = 1$ to $i = m - 1$, do the following:
 - (a) Let $k = \frac{x^{\deg(B_{i,i})} \circ B_{i,i}}{x^{\deg(F_{i,i})} \circ F_{i,i}}$.
 - (b) Scale $B_{i,i}$ by k and $B_{i+1,i+1}$ by $\frac{1}{k}$ using [procedure 35](#).
 - (c) Now verify that $F_{i,i} = B_{i,i}$.

9. Now verify that $x^m \circ \det(F) = x^m \circ \det(xI_m - \text{bdiag}(E)) = 1 = x^m \circ \det(xI_m - A) = x^m \circ \det(B)$.

10. Therefore verify that
$$\begin{aligned} F_{m,m} &= \frac{x^{\deg(F_{m,m})} \circ \det(F)}{x^{m-\deg(F_{m,m})} \circ (\det(F_{[1:m], [1:m]}))} = \frac{x^m \circ \det(B)}{x^{m-\deg(B_{m,m})} \circ (\det(B_{[1:m], [1:m]}))} = x^{\deg(B_{m,m})} \circ B_{m,m}. \end{aligned}$$

11. Therefore verify that $F_{m,m} = B_{m,m}$.

12. **Therefore verify that $F = B$.**

2.42 Procedure 42

2.42.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute [procedure 38](#) on A and let $\langle a \rangle$ receive the result. Let $E_i = \text{rcan}(\text{mon}(B_{a-1+i, a-1+i}))$ for $i = 1$ to $i = m + 1 - a$. The objective of the following instructions is to construct $\mathcal{M}_{m,m}(\mathbb{Q})$ s R, T such that $A = R \text{bdiag}(E)T$, $RT = I_m$, and $TR = I_m$.

2.42.2 Implementation

1. Execute [procedure 21](#) on the polynomial matrix $xI_m - A$ and let $\langle P, B, , Q \rangle$ be the result.
2. Verify that $P_*(xI_m - A)Q_* = B$.
3. Verify that $xI_m - A = P^{-1} * B Q^{-1} *$.
4. Let Z be a variant of [procedure 21](#) where every occurrence of [procedure 10](#) in its instructions is replaced with [procedure 41](#), and where every mention of v is ignored.

5. Execute procedure Z on the matrix $xI_m - \text{bdiag}(E)$ and let $\langle M, \cdot, N \rangle$ receive the result.
6. Verify that $M_*(xI_m - \text{bdiag}(E))N_* = B$.
7. Verify that $xI_m - A = P^{-1}_*BQ^{-1}_* = P^{-1}_*M(xI_m - \text{bdiag}(E))NQ^{-1}_*$.
8. Execute **procedure 32** on the matrices $\langle A, P^{-1}_*M, \text{bdiag}(E), NQ^{-1}_* \rangle$. Let the tuple $\langle R, T \rangle$ be the result.
9. Verify that $A = R \text{bdiag}(E)T$.
10. Verify that $RT = I_m$.
11. Verify that $TR = I_m$.
12. Yield the tuple $\langle R, E, T \rangle$.

2.43 Procedure 43

2.43.1 Objective

Choose a $\mathbb{Q}[x]$, $r = r_0x^t + r_1x^{t-1} + \dots + r_tx^0$, and $\mathcal{M}_{m,m}(\mathbb{Q})$ s, R, A, S such that $SR = I_m$. The objective of the following instructions is to show that $r(RAS) = Rr(A)S$.

2.43.2 Implementation

1. Verify that $r(RAS) = r_0(RAS)^t + r_1(RAS)^{t-1} + \dots + r_t(RAS)^0 = r_0RA^tS + r_1RA^{t-1}S + \dots + r_tRA^0S = R(r_0A^t + r_1A^{t-1} + \dots + r_tA^0)S = Rr(A)S$.

2.44 Procedure 44

2.44.1 Objective

Choose a list of $\mathcal{M}_{m,m}(\mathbb{Q})$ s, A , and a $\mathbb{Q}[x]$, $r = r_0x^t + r_1x^{t-1} + \dots + r_tx^0$. The objective of the following instructions is to show that $r(\text{bdiag}(A)) = \text{bdiag}(r(A))$.

2.44.2 Implementation

1. For $i = 0$ up to $i = t$, by repeated applications of **procedure 9**, verify that $\text{bdiag}(A)^i$ evaluates to $\text{bdiag}(A^i)$ (where the exponentiation is done element-wise).

2. **Therefore verify that** $r(\text{bdiag}(A)) = r_0 \text{bdiag}(A)^t + r_1 \text{bdiag}(A)^{t-1} + \dots + r_t \text{bdiag}(A)^0 = r_0 \text{bdiag}(A^t) + r_1 \text{bdiag}(A^{t-1}) + \dots + r_t \text{bdiag}(A^0) = \text{bdiag}(r_0A^t) + \text{bdiag}(r_1A^{t-1}) + \dots + \text{bdiag}(r_tA^0) = \text{bdiag}(r(A))$ (where r is applied element-wise).

2.45 Procedure 45

2.45.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A , and a $\mathbb{Q}[x]$, r . Execute **procedure 42** on the matrix A and let the tuple $\langle R_1, E, R_3 \rangle$ receive the result. The objective of the following instructions is to show that $r(A) = R_1 \text{bdiag}(r(E))R_3$ (where r is applied element-wise).

2.45.2 Implementation

1. Verify that $R_3R_1 = I_m$.
2. Using **procedure 43**, verify that $r(A) = r(R_1 \text{bdiag}(E)R_3) = R_1r(\text{bdiag}(E))R_3$.
3. Using **procedure 44**, verify that $r(\text{bdiag}(E)) = \text{bdiag}(r(E))$ (where r is applied element-wise).
4. **Therefore verify that** $r(A) = R_1 \text{bdiag}(r(E))R_3$ (where r is applied element-wise).

Let us use the notation e_i as a shorthand for "the $\mathcal{M}_{k,1}(\mathbb{Q})$ that is 0, except for its i^{th} entry which is 1".

Let us use the notation $0_{m \times n}$ as a shorthand for "the $\mathcal{M}_{m,m}(\mathbb{Q})$ such that every entry is 0".

2.46 Procedure 46

2.46.1 Objective

Choose a $\mathbb{Q}[x]$ $p = x^k + p_1x^{k-1} + p_2x^{k-2} + \dots + p_kx^0$ such that $k > 0$. The objective of the following instructions is to show that $p(\text{rcan}(p)) = 0_{k \times k}$.

2.46.2 Implementation

1. Let $G = \text{rcan}(p)$.

2. Then by G 's construction, for $i = 1$ up to $i = k$, verify that $G^{i-1}e_1 = G^{i-2}e_2 = \dots = G^0e_i = e_i$.
3. Therefore, for $i = 1$ up to $i = k$: Cognizant of the construction of G 's last column, verify that $p(G)e_i = (G^k + p_1G^{k-1} + p_2G^{k-2} + \dots + p_kG^0)e_i = (G^k + p_1G^{k-1} + p_2G^{k-2} + \dots + p_kG^0)G^{i-1}e_1 = G^{i-1}(GG^{k-1} + p_1G^{k-1} + p_2G^{k-2} + \dots + p_kG^0)e_1 = G^{i-1}(Ge_k + p_1e_k + p_2e_{k-1} + \dots + p_ke_1) = G^{i-1}0_{k \times 1} = 0_{k \times 1}$.
4. Therefore verify that $p(G) = 0_{k \times k}$.

2.47 Procedure 47

2.47.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to define the $\mathbb{Q}[x]$ last_A and show that either $1 = 0$ or $\text{last}_A \neq 0$.

2.47.2 Implementation

1. Execute [procedure 21](#) on the polynomial matrix $xI_m - A$ and let the tuple $\langle B, , \rangle$ receive the result.
2. Execute [procedure 36](#) on A .
3. Verify that $B_{m,m} \neq 0$.
4. Yield $\langle B_{m,m} \rangle$.

2.48 Procedure 48

2.48.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to show that $\text{last}_A(A) = 0_{m \times m}$.

2.48.2 Implementation

1. Execute [procedure 21](#) on the matrix A and let the tuple $\langle M, B, v, N \rangle$ receive the result.
2. Execute [procedure 38](#) on A and let $\langle a \rangle$ receive.
3. Execute [procedure 42](#) on A and let $\langle R, E, T \rangle$ receive.
4. For $j = 1$ to $j = |E|$:

- (a) Verify that $E_j = \text{rcan}(\text{mon}(B_{a-1+j, a-1+j}))$.
- (b) Verify that $\text{last}_A = B_{m,m} = B_{a-1+j, a-1+j}v_{a+j}v_{a+j+1} \dots v_m$.
- (c) Let $k = \deg(\text{mon}(B_{a-1+j, a-1+j}))$.
- (d) Therefore using [procedure 46](#) verify that $\text{last}_A(E_j) = B_{m,m}(E_j) = B_{a-1+j, a-1+j}(\text{rcan}(\text{mon}(B_{a-1+j, a-1+j}))) \cdot v_{a+j}(E_j)v_{a+j+1}(E_j) \dots v_m(E_j) = 0_{k \times k}v_{a+j}(E_j)v_{a+j+1}(E_j) \dots v_m(E_j) = 0_{k \times k}$.

5. Therefore using [procedure 45](#) verify that $\text{last}_A(A) = R \text{bdiag}(\text{last}_A(E))T = R \text{bdiag}(B_{m,m}(E))T = R0_{m \times m}T = 0_{m \times m}$.

2.49 Procedure 49

2.49.1 Objective

Choose a monic $\mathbb{Q}[x]$ p such that $\deg(p) > 0$. Choose a $\mathbb{Q}[x]$ $g = g_0x^k + g_1x^{k-1} + \dots + g_kx^0$ such that $g_0 \neq 0$ and $k < \deg(p)$. The objective of the following instructions is to show that $g(\text{rcan}(p)) \neq 0_{\deg(p) \times \deg(p)}$.

2.49.2 Implementation

1. Let $G = \text{rcan}(p)$.
2. Therefore cognizant of G 's construction, verify that $g(G)e_1 = (g_0G^k + g_1G^{k-1} + \dots + g_kG^0)e_1 = g_0e_{k+1} + g_1e_k + \dots + g_we_1 \neq 0_{\deg(p) \times 1}$.
3. Therefore verify that $g(G) \neq 0_{\deg(p) \times \deg(p)}$.

2.50 Procedure 50

2.50.1 Objective

Choose two $\mathbb{Q}[x]$ s $g = g_0x^k + g_1x^{k-1} + \dots + g_kx^0$, $p = x^k + p_1x^{k-1} + p_2x^{k-2} + \dots + p_kx^0$ such that $\deg(p) = \deg(g) > 0$ and $g(\text{rcan}(p)) = 0_{\deg(p) \times \deg(p)}$. The objective of the following instructions is to show that $g = g_0p$.

2.50.2 Implementation

1. Let $G = \text{rcan}(p)$.

2. Let $u = \deg(g)$.
3. Cognizant of G 's construction, verify that $0_{u \times 1} = g(G)e_1 = (g_0G^u + g_1G^{u-1} + g_2G^{u-2} + \dots + g_uG^0)e_1 = g_0Ge_u + g_1e_u + g_2e_{u-1} + \dots + g_ue_1$.
4. Therefore for $i = 1$ to $i = u$, do the following:
 - (a) Verify that $0 = (g_0Ge_u + g_1e_u + g_2e_{u-1} + \dots + g_ue_1)_{i,1}$.
 - (b) Therefore cognizant of G 's construction, verify that $-g_0p_{u+1-i} + g_{u+1-i} = 0$.
 - (c) Therefore verify that $g_{u+1-i} = g_0p_{u+1-i}$.
5. **Therefore verify that $g = g_0p$.**
12. Therefore using **procedure 46**, verify that $g(A) = N_{1,1}(A)p(A) + N_{2,1}(A)\text{last}_A(A) = N_{1,1}(A)0_{m \times m} + N_{2,1}(A)0_{m \times m} = 0_{m \times m}$.
13. Execute **procedure 42** on the matrix A and let the tuple $\langle R_1, E, R_3 \rangle$ receive the result.
14. Using **procedure 45**, and **procedure 42**, verify that $\text{bdiag}(g(E)) = I_m \text{bdiag}(g(E))I_m = R_3R_1 \text{bdiag}(g(E))R_3R_1 = R_3g(A)R_1 = R_30_{m \times m}R_1 = 0_{m \times m}$.
15. Let $G = \text{rcan}(\text{mon}(\text{last}_A))$.
16. Verify that $g(G) = g(E_{|E|}) = \text{bdiag}(g(E))_{[m-u+1:m+1], [m-u+1:m+1]} = 0_{u \times u}$.
17. If $w < u$, then:
 - (a) Using **procedure 49**, verify that $g(G) \neq 0_{u \times u}$.
 - (b) **Abort procedure.**

2.51 Procedure 51

2.51.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Choose a $\mathbb{Q}[x]$ $p = p_0x^t + p_1x^{t-1} + p_2x^{t-2} + \dots + p_tx^0$ where $p_0 \neq 0$, such that $p(A) = 0_{m \times m}$. The objective of the following instructions is to either show that $0 \neq 0$ or to construct a $\mathbb{Q}[x]$ f such that $p = f \text{last}_A$.

2.51.2 Implementation

1. Let F be a 1×2 matrix consisting in-order of p and last_A .
2. Execute **procedure 21** on F and let $\langle M, D, , N \rangle$ receive the result.
3. Verify that $D_{1,1} \neq 0$.
4. Let $g = g_0x^w + g_1x^{w-1} + g_2x^{w-2} + \dots + g_wx^0 = D_{1,1}$ in such a way that $g_0 \neq 0$.
5. Verify that $F = M^{-1}DN^{-1} = DN^{-1}$.
6. Verify that $\text{last}_A = F_{1,2} = D_{1,1}N^{-1}_{1,2} + D_{1,2}N^{-1}_{2,2} = D_{1,1}N^{-1}_{1,2} = gN^{-1}_{1,2}$.
7. Let $u = \text{last}_A$.
8. Therefore verify that $N^{-1}_{1,2} \neq 0$.
9. Therefore verify that $u = \deg(\text{last}_A) = \deg(D_{1,1}N^{-1}_{1,2}) \geq \deg(D_{1,1}) = \deg(g) = w$.
10. Verify that $D = MFN = FN$.
11. Therefore verify that $g = D_{1,1} = N_{1,1}p + N_{2,1}\text{last}_A$.

18. Otherwise, do the following:
 - (a) Verify that $w = u$.
 - (b) Using **procedure 50**, verify that $g = g_0\text{last}_A$.
 - (c) **Therefore verify that $p = F_{1,1} = D_{1,1}N^{-1}_{1,1} + D_{1,2}N^{-1}_{2,1} = N^{-1}_{1,1}g + N^{-1}_{2,1} * 0 = N^{-1}_{1,1}g = N^{-1}_{1,1}g_0\text{last}_A$.**
 - (d) **Yield the tuple $\langle N^{-1}_{1,1}g_0 \rangle$.**

2.52 Procedure 52 (Difference of powers)

2.52.1 Objective

Choose an integer $n \geq 0$ and a $\mathbb{Q}[x]$ $p = p_0x^n + p_1x^{n-1} + \dots + p_n$. Let y, z be indeterminates. The objective of the following instructions is to construct a $\mathbb{Q}[y, z]$ G such that $p(z) - p(y) = (z - y)G(y, z)$.

2.52.2 Implementation

1. Let the $\mathbb{Q}[y, z]$ $G = \sum_{r=1}^n p_{n-r}(z^{r-1} + z^{r-2}y + \dots + zy^{r-2} + y^{r-1})$.
2. **Verify that the $p(z) - p(y) = (p_0z^n + p_1z^{n-1} + \dots + p_n) - (p_0y^n + p_1y^{n-1} + \dots + p_n) = (\sum_{r=0}^n p_{n-r}z^r) - (\sum_{r=0}^n p_{n-r}y^r) = \sum_{r=1}^n p_{n-r}(z^r - y^r) = \sum_{r=1}^n p_{n-r}(z - y)(z^{r-1} + \dots + zy^{r-2} + y^{r-1})$.**

$$z^{r-2}y + \cdots + zy^{r-2} + y^{r-1} = (z - y) \sum_{r=1}^n p_{n-r}(z^{r-1} + z^{r-2}y + \cdots + zy^{r-2} + y^{r-1}) = (z - y)G(y, z).$$

3. Yield the tuple $\langle G \rangle$.

2.53 Procedure 53

2.53.1 Objective

Choose a $\mathbb{Q}[x]$ $p = x^n + p_1x^{n-1} + \cdots + p_n$ and \mathbb{Q} s $a_1 < a_2 < \cdots < a_n < a_{n+1}$ in such a way that for $i = 1$ to $i = n + 1$, $p(a_i) = 0$. The objective of the following instructions is to show that $0 \neq 0$.

2.53.2 Implementation

1. Write p as $1 * p$, so that it has two factors.
2. For $i = 1$ up to $i = n$, do the following:
 - (a) Let g be the rightmost factor of p .
 - (b) If $g(a_i) \neq 0$, do the following:
 - i. For $k = 1$ to $k = i - 1$, verify that $(a_i - a_k) \neq 0$.
 - ii. Verify that $p(a_i) \neq 0$.
 - iii. Therefore verify that $0 \neq 0$.
 - iv. **Abort procedure.**
 - (c) Otherwise $g(a_i) = 0$. Now do the following:
 - i. Execute **procedure 52** on g and let the tuple $\langle G \rangle$ receive the result.
 - ii. Let x be an indeterminate.
 - iii. Let the $\mathbb{Q}[x]$ $q = q(x) = G(a_i, x)$.
 - iv. Verify that the $\mathbb{Q}[x]$ $g = g(x) = g(x) - g(a_i) = (x - a_i)G(a_i, x) = (x - a_i)q(x) = (x - a_i)q$.
 - v. Verify that $p = (x - a_1)(x - a_2) \cdots (x - a_i)q$.
3. Now verify that $p = (x - a_1)(x - a_2) \cdots (x - a_n)1$.
4. Using (3), verify that $p(a_{n+1}) \neq 0$.
5. Therefore verify that $0 \neq 0$.
6. **Abort procedure.**

2.54 Procedure 54 (Bisection)

2.54.1 Objective

Choose a $\mathbb{Q}[x]$ f . Choose \mathbb{Q} s $a < b$ such that $\text{sgn}(f(a)) = -\text{sgn}(f(b))$. Choose a rational number target $B > 0$. The objective of the following instructions is to construct a \mathbb{Q} d such that $a \leq d \leq b$ and $|f(d)| < B$.

2.54.2 Implementation

1. Execute **procedure 52** on f and let the tuple $\langle G \rangle$ receive the result.
2. Let x, y be indeterminates.
3. Verify that the $\mathbb{Q}[x, y]$ $f(y) - f(x) = (y - x)G(x, y)$.
4. Let $c = a$ and $d = b$.
5. Until $|d - c||G|(|a|, |b|) < B$
 - (a) Let $e = \frac{c+d}{2}$.
 - (b) If $\text{sgn}(f(c)) = -\text{sgn}(f(e))$, then:
 - i. Let $d = e$.
 - (c) Otherwise if $\text{sgn}(f(e)) = -\text{sgn}(f(d))$, then:
 - i. Let $c = e$.
 - (d) Otherwise if $f(e) = 0$, then do the following:
 - i. **Verify that** $|f(e)| = 0 < B$.
 - ii. Yield the tuple $\langle e \rangle$.
6. **Verify that** $|f(c)|, |f(d)| < |f(d) - f(c)| = |(d - c)G(c, d)| = |d - c||G(c, d)| \leq |d - c||G|(|c|, |d|) \leq |d - c||G|(|a|, |b|) < B$.
7. **Yield the tuple** $\langle c \rangle$.

2.55 Procedure 55

2.55.1 Objective

Choose a $\mathbb{Q}[x]$ $f = x^n + p_1x^{n-1} + \cdots + p_n$ and pairs of \mathbb{Q} s $(a_n, b_n), (a_{n-1}, b_{n-1}), \cdots, (a_0, b_0)$ in such a way that:

1. $a_n < b_n \leq a_{n-1} < b_{n-1} \leq \cdots \leq a_1 < b_1 \leq a_0 < b_0$.

2. $\text{sgn}(f(a_i)) = -\text{sgn}(f(b_i))$ for $i = 0$ to $i = n$.

The objective of the following instructions is to show that $1 = -1$.

2.55.2 Implementation

1. If $n > 0$:
 - (a) Let $B = \min_{k=0}^{n-1} \min(|f(a_k)|, |f(b_k)|)$.
 - (b) For $k = 0$ to $k = n-1$, verify that $|f(a_k)| \geq B$.
 - (c) Execute **procedure 54** on the formal polynomial f , interval (a_n, b_n) , and target of B . Let the tuple $\langle d \rangle$ receive the result.
 - (d) Verify that $|f(d)| < B$.
 - (e) Execute **procedure 52** on the formal polynomial f and let the tuple $\langle G \rangle$ receive the result.
 - (f) Let x be an indeterminate.
 - (g) Let the formal polynomial $h = G(d, x)$.
 - (h) Verify that h is a monic $(n-1)^{\text{th}}$ degree formal polynomial.
 - (i) Verify that the formal polynomial $f = f(x) = f(x) - f(d) + f(d) = (x-d)G(d, x) + f(d) = (x-d)h(x) + f(d) = (x-d)h + f(d)$.
 - (j) For $k = 0$ to $k = n-1$, do the following:
 - i. If $f(a_k) \geq B$, in-order verify that:
 - A. $f(a_k) \geq B > |f(d)| \geq f(d)$.
 - B. $f(a_k) - f(d) > 0$.
 - C. $(a_k - d)h(a_k) > 0$.
 - D. $h(a_k) > 0$.
 - E. $f(b_k) \leq -B < -|f(d)| \leq f(d)$.
 - F. $f(b_k) - f(d) < 0$.
 - G. $(b_k - d)h(b_k) < 0$.
 - H. $h(b_k) < 0$.
 - ii. Otherwise, if $f(a_k) \leq -B$, do the following:
 - A. **Using steps analogous to (ji), verify that $h(a_k) < 0$.**

B. Using steps analogous to (ji), verify that $h(b_k) > 0$.

- (k) Execute **procedure 55** on h and $a_{n-1} < b_{n-1} \leq a_{n-2} < b_{n-2} \leq \dots \leq a_1 < b_1 \leq a_0 < b_0$.

2. Otherwise, do the following:

- (a) Verify that $n = 0$.
- (b) Therefore verify that $h = 1$.
- (c) **Therefore verify that $1 = \text{sgn}(1) = \text{sgn}(f_0(a_0)) = -\text{sgn}(f_0(b_0)) = -\text{sgn}(1) = -1$.**
- (d) **Abort procedure.**

2.56 Procedure 56 (Sturm's procedure initialization)

2.56.1 Objective

Choose two lists of $\mathbb{Q}[x]$ s s, q in such a way that, letting $m = |s| - 1$,

1. For $i = 0$ to $i = m$, $\deg(s_i) = i$.
2. For $i = 0$ to $i = m$, $x^i \circ s_i > 0$.
3. For $i = 1$ to $i = m-1$, $s_{i-1} + s_{i+1} = q_i s_i$.

Let x, y be indeterminates. The objective of the following instructions is to construct lists of $\mathbb{Q}[x]$ s g, h such that $g_i s_{i+1} + h_i s_i = 1$ for $i = 1$ to $i = m-1$.

2.56.2 Implementation

1. Let $g = h = \langle \rangle$.
2. If $m > 2$, do the following:
 - (a) Verify that $q_{m-1}s_{m-1} - s_m = s_{m-2}$.
 - (b) Execute **procedure 56** on $s_{[0:m]}$ and $q_{[1:m-1]}$ and let the tuple $\langle, , g, h \rangle$ receive.
 - (c) Verify that $g_{m-2}s_{m-1} + h_{m-2}s_{m-2} = 1$.
 - (d) Let $g_{m-1} = -h_{m-2}$.
 - (e) Let $h_{m-1} = g_{m-2} + h_{m-2}q_{m-1}$.
 - (f) **Therefore verify that $g_{m-1}s_m + h_{m-1}s_{m-1} = g_{m-2}s_{m-1} + h_{m-2}(q_{m-1}s_{m-1} - s_m) = g_{m-2}s_{m-1} + h_{m-2}s_{m-2} = 1$.**

3. Otherwise, if $m = 2$ do the following:

- (a) Verify that $s_0 + s_2 = q_1 s_1$.
- (b) Let $g_1 = -\frac{1}{s_0}$.
- (c) Let $h_1 = \frac{q_1}{s_0}$.
- (d) **Therefore verify that** $g_1 s_2 + h_1 s_1 = 1$.

4. **Yield the tuple** $\langle s, q, g, h \rangle$.

Let us use the notation $J_s(x)$ as a shorthand for "the number of sign changes in the list $s_0(x), s_1(x), \dots, s_{|s|-1}(x)$ ".

2.57 Procedure 57 (Change in number of sign changes verification)

2.57.1 Objective

Execute **procedure 56** and let $\langle s, q, g, h \rangle$ receive. Execute **procedure 52** on s and let $\langle G \rangle$ receive the result. Choose Q s c and d in such a way that:

- 1. $J_m(c)$ and $J_m(d)$ are well defined.
- 2. Letting $B = \max_{i=1}^m |G_i(c, d)|$.
- 3. Letting $C = \max_{i=1}^{m-1} \max(|g_i(c)|, |h_i(c)|, |g_i(d)|, |h_i(d)|)$.
- 4. Letting $D = \max_{i=1}^{m-1} \max(|q_i(c)|, |q_i(d)|, 2)$.
- 5. $|d - c| \leq \frac{1}{BCD}$.

The objective of the following instructions is to show that either $0 < 0$ or $|J_m(d) - J_m(c)| = [\text{sgn}(s_m(c)) \neq \text{sgn}(s_m(d))]$.

2.57.2 Implementation

- 1. Let $i = 0$.
- 2. Do the following:
 - (a) Verify that $\text{sgn}(s_i(c)) = \text{sgn}(s_i(d))$.
 - (b) Verify that $J_i(c) = J_i(d)$.
 - (c) If $\text{sgn}(s_{i+1}(c)) = \text{sgn}(s_{i+1}(d))$, do the following:
 - i. Verify that $J_{i+1}(c) = J_{i+1}(d)$.
 - ii. Set i to $i + 1$ and go to (2) if the new $i < m$.
 - (d) Otherwise, if $\text{sgn}(s_{i+1}(c)) \neq \text{sgn}(s_{i+1}(d))$ and $i + 2 \leq m$, do the following:

i. Execute **procedure 57 auxilliary procedure** on i .

ii. If $\text{sgn}(s_{i+2}(c)) \neq \text{sgn}(s_{i+2}(d))$, do the following:

- A. Verify that $|s_{i+2}(c)| < |s_{i+2}(d) - s_{i+2}(c)| = |(d - c)G_{i+2}(c, d)| \leq \frac{1}{BCD} \cdot B = \frac{1}{CD} = \frac{1}{C} \cdot \frac{1}{D} \leq \frac{1}{C} (1 - \frac{1}{D})$.
- B. Using (A) and (i), verify that $\frac{1}{C} (1 - \frac{1}{D}) < |s_{i+2}(c)| < \frac{1}{C} (1 - \frac{1}{D})$.

C. **Abort procedure.**

iii. Otherwise if $\text{sgn}(s_i(c)) = \text{sgn}(s_{i+2}(c))$, do the following:

- A. Verify that $2\frac{1}{C}(1 - \frac{1}{D}) < |s_i(c)| + |s_{i+2}(c)| = |s_i(c) + s_{i+2}(c)| = |q_{i+1}(c)s_{i+1}(c)| < D\frac{1}{CD}$.
- B. Verify that $2(1 - \frac{1}{D}) < 1$.
- C. Using (B) and the construction of D , verify that $2 \leq D < 2$.

D. **Abort procedure.**

iv. Otherwise, do the following:

- A. Verify that $\text{sgn}(s_i(d)) = \text{sgn}(s_i(c)) \neq \text{sgn}(s_{i+2}(c)) = \text{sgn}(s_{i+2}(d))$.
- B. Therefore verify that $1 = J_{i+2}(c) - J_i(c) = J_{i+2}(d) - J_i(d)$.
- C. Therefore verify that $J_i(c) + 1 = J_{i+2}(c) = J_{i+2}(d) = J_i(d) + 1$.
- D. Set i to $i + 2$ and go to (2).

(e) Otherwise, verify the following:

- i. $\text{sgn}(s_{i+1}(c)) \neq \text{sgn}(s_{i+1}(d))$.
- ii. $|J_{i+1}(c) - J_{i+1}(d)| = 1$.
- iii. $i + 1 = m$.

3. **If** $\text{sgn}(s_m(c)) = \text{sgn}(s_m(d))$, **then do the following:**

(a) **Verify that** $J_m(c) = J_m(d)$.

4. **Otherwise do the following:**

(a) **Verify that** $|J_m(d) - J_m(c)| = 1$.

2.57.3 Auxilliary Procedure

Objective Choose a non-negative integer $i < m$ such that $\text{sgn}(s_{i+1}(c)) \neq \text{sgn}(s_{i+1}(d))$ and $i + 2 \leq m$. The objective of the following instructions is to show that $|s_{i+1}(c)| < \frac{1}{CD}$, $|s_{i+1}(d)| < \frac{1}{CD}$, $\frac{1}{C}(1 - \frac{1}{D}) < |s_i(c)|$, $\frac{1}{C}(1 - \frac{1}{D}) < |s_i(d)|$, $\frac{1}{C}(1 - \frac{1}{D}) < |s_{i+2}(c)|$, and $\frac{1}{C}(1 - \frac{1}{D}) < |s_{i+2}(d)|$.

Implementation

1. Verify the following in order:

- (a) $|s_{i+1}(c)| < |s_{i+1}(c) - s_{i+1}(d)| = |c - d| |G_{i+1}(c, d)| \leq |c - d| B \leq lB = \frac{1}{CD}$
- (b) $|s_{i+1}(d)| < |s_{i+1}(c) - s_{i+1}(d)| \leq \frac{1}{CD}$
- (c) $1 = g_i(c)s_{i+1}(c) + h_i(c)s_i(c) = |g_i(c)s_{i+1}(c) + h_i(c)s_i(c)| \leq |g_i(c)||s_{i+1}(c)| + |h_i(c)||s_i(c)| < C(\frac{1}{CD} + |s_i(c)|)$
- (d) $\frac{1}{C}(1 - \frac{1}{D}) < |s_i(c)|$
- (e) $1 < C(\frac{1}{CD} + |s_i(d)|)$
- (f) $\frac{1}{C}(1 - \frac{1}{D}) < |s_i(d)|$
- (g) $1 = g_{i+1}(c)s_{i+2}(c) + h_{i+1}(c)s_{i+1}(c) = |g_{i+1}(c)s_{i+2}(c) + h_{i+1}(c)s_{i+1}(c)| \leq |g_{i+1}(c)||s_{i+2}(c)| + |h_{i+1}(c)||s_{i+1}(c)| < C(|s_{i+2}(c)| + \frac{1}{CD})$
- (h) $\frac{1}{C}(1 - \frac{1}{D}) < |s_{i+2}(c)|$
- (i) $1 < C(|s_{i+2}(d)| + \frac{1}{CD})$
- (j) $\frac{1}{C}(1 - \frac{1}{D}) < |s_{i+2}(d)|$

2.58 Procedure 58 (Cauchy's positive verification)

2.58.1 Objective

Choose a $\mathbb{Q}[x]$ $p = p_0x^t + p_1x^{t-1} + p_2x^{t-2} + \dots + p_tx^0$, where $p_0 > 0$. Choose a \mathbb{Q} $k > 1 + \max_{i=1}^t |\frac{p_i}{p_0}|$. The objective of the following instructions is to show that $p(k) > 0$.

2.58.2 Implementation

1. In reverse order verify the following:

- (a) $p(k) > 0$

- (b) $p_0k^n + p_1k^{n-1} + \dots + p_nk^0 > 0$
- (c) $k^n + \frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0 > 0$
- (d) $k^n > -(\frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0)$
- (e) $k^n > |\frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0|$
- (f) $k^n > |\max_{i=1}^t |\frac{p_i}{p_0}| (k^{n-1} + \dots + k^0)|$
- (g) $k^n > \max_{i=1}^t |\frac{p_i}{p_0}| \frac{k^n - 1}{k - 1}$
- (h) $k^{n+1} - k^n > \max_{i=1}^t |\frac{p_i}{p_0}| (k^n - 1)$
- (i) $k^{n+1} - (1 + \max_{i=1}^t |\frac{p_i}{p_0}|)k^n + \max_{i=1}^t |\frac{p_i}{p_0}| > 0$
- (j) $k > 1 + \max_{i=1}^t |\frac{p_i}{p_0}|$

2.59 Procedure 59 (Cauchy's alternation verification)

2.59.1 Objective

Choose a $\mathbb{Q}[x]$ $p = p_0x^t + p_1x^{t-1} + p_2x^{t-2} + \dots + p_tx^0$, where $p_0 > 0$. Choose a \mathbb{Q} $k < -(1 + \max_{i=1}^t |\frac{p_i}{p_0}|)$. The objective of the following instructions is to show that $(-1)^t p(k) > 0$.

2.59.2 Implementation

- 1. Let $q = q_0x^t + q_1x^{t-1} + q_2x^{t-2} + \dots + q_tx^0$, where $q_i = (-1)^i p_i$.
- 2. Verify that $k < -(1 + \max_{i=1}^t |\frac{q_i}{q_0}|)$.
- 3. Therefore verify that $-k > 1 + \max_{i=1}^t |\frac{q_i}{q_0}|$.
- 4. Execute [procedure 58](#) on q and $-k$.
- 5. Therefore, verify that $(-1)^t p(k) = (-1)^t \sum_{i=0}^t p_i k^{t-i} = \sum_{i=0}^t (-1)^i (-1)^{t-i} p_i k^{t-i} = \sum_{i=0}^t q_i (-k)^{t-i} = q(-k) > 0$.

2.60 Procedure 60

2.60.1 Objective

Choose a list of $\mathbb{Q}[x]$ s, s , and \mathbb{Q} s a, l, c such that $a < c$ and $l > 0$. The objective of the following instructions is to either show that $0 < 0$ or to construct a list of \mathbb{Q} s, b , such that $a = b_1 < b_2 < \dots < b_{|b|} = c$, $b_{i+1} - b_i \leq l$ for $i = 1$ to $i = |b| - 1$, and $J_s(b)$ is defined for $i = 1$ to $i = |b| - 1$.

2.60.2 Implementation

1. Let $e = \langle \langle \rangle, \langle \rangle, \dots, \langle \rangle \rangle$.
2. Let $f = \sum_{r=1}^{|s|} \deg(s_r)$.
3. Let $b = \langle a \rangle$.
4. Let $d = b_1$.
5. While $d + l < c$, do the following:
 - (a) Let $m = l$.
 - (b) While $J_s(d + m)$ is not defined and $|e| \leq f$, do the following:
 - i. Let $1 \leq i \leq |s|$ be an integer such that $s_i(d + m) = 0$.
 - ii. Append $d + m$ onto e_i .
 - iii. Set $m = \frac{m}{2}$.
 - (c) If $\sum |e| > f$, then do the following:
 - i. If $|e_i| \leq \deg(s_i)$ for $1 \leq i \leq |s|$, then do the following:
 - A. Verify that $\sum |e| \leq f$.
 - B. Therefore using (c), verify that $\sum |e| \leq f < \sum |e|$.
 - C. **Abort procedure.**
 - ii. Otherwise, do the following:
 - A. Let $1 \leq i \leq |s|$ be an integer such that $|e_i| > \deg(s_i)$.
 - B. Execute **procedure 53** on s_i and a sorted e_i .
 - C. **Abort procedure.**
 - (d) Otherwise, do the following:
 - i. **Verify that $J_s(d + m)$ is defined.**
 - ii. Append $d + m$ onto b .
 - iii. **Verify that $0 < b_{|b|} - b_{|b|-1} = m \leq l$.**
 - iv. Set d to $d + m$.
 - v. Using (5), verify that $d < c$.
6. Verify that $d < c$.
7. Verify that $d + l \geq c$.
8. **Therefore verify that $0 < c - d \leq l$.**
9. Append c onto b .

10. Yield $\langle b \rangle$.

2.61 Procedure 61 (Sturm's sign change)

2.61.1 Objective

Execute **procedure 56** and let $\langle s, q, g, h \rangle$ receive. Let $m = |s| - 1$. The objective of the following instructions is to either show that $0 < 0$ or to construct two lists of rational numbers c, d such that $c_1 < d_1 \leq c_2 < d_2 \leq \dots \leq c_m < d_m$ and $\text{sgn}(s_m(c_i)) = -\text{sgn}(s_m(d_i))$ for $i = 1$ to $i = m$.

2.61.2 Implementation

1. Let $U = 1 + \max_{i=0}^m \left(1 + \max_{j=1}^i \left| \frac{x^{i-j} \circ s_i}{x^i \circ s_i} \right| \right)$
2. Using **procedure 58**, verify that $J(U) = 0$.
3. Using **procedure 59**, verify that $J(-U) = m$.
4. Execute **procedure 52** on s and let $\langle G \rangle$ receive the result.
5. Let the rational $B = \max_{i=1}^m |G_i|(U, U)$.
6. Let $C = \max_{i=1}^m \max(|g_i|(U), |h_i|(U))$.
7. Let $D = \max(3, \max_{i=1}^m |q_i|(U))$.
8. Let $l = \frac{1}{BCD}$.
9. Execute **procedure 60** on s with endpoints $-U, U$ and a step size of l and let $\langle e \rangle$ receive the result.
10. Let $c = d = \langle \rangle$.
11. For $i = 1$ to $i = |e| - 1$:
 - (a) Execute **procedure 57** on the tuple $\langle e_i, e_{i+1} \rangle$.
 - (b) If $J_m(c) \neq J_m(d)$, then do the following:
 - i. Append e_i to c .
 - ii. Append e_{i+1} to d .
 - iii. Cognizant of **procedure 57**, verify that $|J_m(d) - J_m(c)| = 1$.
 - iv. Therefore verify that $\text{sgn}(s_m(c_{|c|})) = -\text{sgn}(s_m(d_{|d|}))$.
 - v. Also verify that $d_{|d|-1} \leq c_{|c|} < d_{|d|}$.

12. If less than m pairs of rational numbers were recorded, then do the following:

- (a) Verify that each change of $J_m(x)$ over the course of (12) was by 1.
- (b) Verify that $J_m(x)$ changed less than m times over the course of (12).
- (c) Therefore verify that $|J_m(U) - J_m(-U)| < m$.
- (d) Therefore using (2) and (3), verify that $m = |J_m(U) - J_m(-U)| < m$.
- (e) **Abort procedure.**

13. Otherwise, do the following:

- (a) Verify that $m \leq |c| = |d|$.
- (b) **Yield the tuple**
 $\langle \langle c_1, d_1 \rangle, \langle c_2, d_2 \rangle, \dots, \langle c_m, d_m \rangle \rangle$.

2.62 Procedure 62

2.62.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to define the $\mathcal{M}_{m^2,*}(\mathbb{Q})$ $\text{pows}(A)$.

2.62.2 Implementation

- 1. Let $t = \deg(\text{last}_A)$.
- 2. Make an $m^2 \times t$ matrix, $\text{pows}(A)$, whose i^{th} column is the sequential concatenation of the columns of A^{t-i} .
- 3. Yield $\langle \text{pows}(A) \rangle$.

2.63 Procedure 63

2.63.1 Objective

Choose an $\mathcal{M}_{m,n}(\mathbb{Q})$, A , and an $\mathcal{M}_{n,m}(\mathbb{Q})$, B , such that $AB = I_m$. The objective of the following instructions is to show that either $0 = 1$ or every column of B is non-zero.

2.63.2 Implementation

- 1. If any column i of B , Be_i , is equal to zero, then:
 - (a) Verify that $0_{n \times 1} = A0_{n \times 1} = A(Be_i) = (AB)e_i = I_me_i = e_i$.
 - (b) Therefore verify that $0=1$.
 - (c) **Abort procedure.**

2.64 Procedure 64

2.64.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Choose a $\mathbb{Q}[x]$ p such that $p \neq 0$, $p(A) = 0$, and $\deg(p) < \deg(\text{last}_A)$. The objective of the following instructions is to show that $0 < 0$.

2.64.2 Implementation

- 1. Execute **procedure 51** on A and p and let f receive.
- 2. Now verify that $p = f \text{last}_A$.
- 3. Verify that $f \neq 0$ and $\text{last}_A \neq 0$.
- 4. **Therefore verify that** $\deg(\text{last}_A) > \deg(p) = \deg(f \text{last}_A) \geq \deg(\text{last}_A)$.
- 5. **Abort procedure.**

2.65 Procedure 65

2.65.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute **procedure 21** on $\text{pows}(A)$ and let the tuple $\langle M, D, , N \rangle$ receive the result. Let $t = \text{cols}(\text{pows}(A))$. The objective of the following instructions is to show that either $0 < 0$ or to show that $C_t(D) = C_t(D)_{1,1}e_1 \neq 0$.

2.65.2 Implementation

- 1. Execute **procedure 21** on $\text{pows}(A)$ and let the tuple $\langle M, D, , N \rangle$ receive the result.
- 2. Verify that $M_* \text{pows}(A) N_* = D$.
- 3. Using **procedure 6**, verify that $M^{-1}MFN = I_{m^2}FN = FN = M^{-1}D$.

4. If $C_t(D)_{1,1} = 0$, then:
 - (a) Verify that for some $1 \leq i \leq t$, $D_{i,i} = 0$.
 - (b) Therefore verify that $De_i = 0_{m^2 \times 1}$.
 - (c) Therefore verify that $F(Ne_i) = (FN)e_i = (M^{-1}D)e_i = M^{-1}(De_i) = 0_{m^2 \times 1}$.
 - (d) Let $p = N_{1,i}x^{t-1} + N_{2,i}x^{t-2} + \dots + N_{t,i}x^0$.
 - (e) Therefore verify that $p(A) = 0_{m \times m}$.
 - (f) Execute **procedure 63** on N^{-1}_* and N_* .
 - (g) Therefore verify that $p \neq 0$.
 - (h) Execute **procedure 64** on A and p .
 - (i) **Abort procedure.**

5. Otherwise, do the following:

- (a) Execute **procedure 19** on D, I_t, t and let E receive.
- (b) Verify that $C_t(D) = C_t(DI_t) = EC_t(I_t) = E * 1 = E$.
- (c) Verify that E is a $\mathcal{D}_{\binom{m^2}{t}, \binom{t}{t}}(\mathbb{Q}[x])$.
- (d) Therefore verify that $C_t(D)$ is a $\mathcal{D}_{\binom{m^2}{t}, 1}(\mathbb{Q}[x])$.
- (e) **Therefore verify that** $C_t(D) = C_t(D)_{1,1}e_1 \neq 0$.

2.66 Procedure 66

2.66.1 Objective

Choose a $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \text{cols}(\text{pows}(A))$. The objective of the following instructions is to show that either $0 < 0$ or to show that $C_t(\text{pows}(A)) \neq 0$.

2.66.2 Implementation

1. Execute **procedure 21** on $\text{pows}(A)$ and let the tuple $\langle M, D, , N \rangle$ receive the result.
2. Verify that $\text{pows}(A) = M^{-1}_*DN^{-1}_*$.
3. Execute **procedure 63** on $C_t(M_*)$, $C_t(M^{-1}_*)$.
4. Verify that all columns of $C_t(M^{-1})$ are non-zero.
5. Let $t = \text{cols}(\text{pows}(A))$.
6. Execute **procedure 65** on A .

7. Verify that $C_t(D) = C_t(D)_{1,1}e_1 \neq 0$.
8. Therefore verify that $C_t(D)_{1,1} \neq 0$.
9. Execute **procedure 63** on $C_t(N_*)$, $C_t(N^{-1}_*)$.
10. Verify that $C_t(N^{-1}) \neq 0$.

$$\begin{aligned}
 11. \text{ Verify that } & C_t(\text{pows}(A)) = \\
 & C_t(M^{-1}DN^{-1}) = C_t(M^{-1})C_t(D)C_t(N^{-1}) = \\
 & C_t(M^{-1})C_t(D)_{1,1}e_1C_t(N^{-1}) = \\
 & C_t(D)_{1,1}C_t(N^{-1})C_t(M^{-1})e_1 \neq 0_{\binom{m^2}{t} \times 1}.
 \end{aligned}$$

Let $\text{mat}_t(p)$ be a shorthand for " $(x^{t-1} \circ p)e_1 + (x^{t-2} \circ p)e_2 + \dots + (x^0 \circ p)e_t$ " in what follows.

Let $\text{pol}(P)$ be a shorthand for " $P_{1,1}x^{t-1} + P_{2,1}x^{t-2} + \dots + P_{t,1}$ where $t = \text{rows}(P)$ " in what follows.

2.67 Procedure 67

2.67.1 Objective

Choose an $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to define the $\mathbb{Q}[x]_{\text{sel}_A}$.

2.67.2 Implementation

1. Using **procedure 27** and **procedure 66**, verify that $C_t(\text{pows}(A)^T \text{pows}(A)) = C_t(\text{pows}(A)^T)C_t(\text{pows}(A)) = C_t(\text{pows}(A))^T C_t(\text{pows}(A)) = \|C_t(\text{pows}(A))\|^2 > 0$.
2. Let $H = (\text{pows}(A)^T \text{pows}(A)) \setminus e_1$.
3. Let $t = \deg(\text{last}_A)$.
4. Let $\text{sel}_A = \frac{\text{pol}(H)}{x^t \circ \text{last}_A}$.
5. Yield $\langle \text{sel}_A \rangle$.

Let us use the notation $\text{tr}(X)$ as a shorthand for "the sum of the diagonal entries of the square matrix X " in what follows.

2.68 Procedure 68

2.68.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \deg(\text{last}_A)$. Choose two $\mathbb{Q}[x]$ s $u = u_1x^{t-1} + u_2x^{t-2} + \dots + u_tx^0$, $w = w_1x^{t-1} + w_2x^{t-2} +$

$\dots + w_t x^0$. The objective of the following instructions is to show that $\text{tr}(u(A)w(A)) = \text{mat}(u)^T \text{pows}(A)^T \text{pows}(A) \text{mat}_t(w)$.

2.68.2 Implementation

1. Verify that $\text{tr}(u(A)w(A))$

$$(a) = \text{tr}((\sum_{p=1}^t u_p A^{t-p})(\sum_{q=1}^t w_q A^{t-q}))$$

$$(b) = \text{tr}(\sum_{p=1}^t \sum_{q=1}^t u_p w_q A^{t-p} A^{t-q})$$

$$(c) = \sum_{p=1}^t \sum_{q=1}^t u_p w_q \text{tr}(A^{t-p} A^{t-q})$$

$$(d) = \sum_{p=1}^t \sum_{q=1}^t u_p w_q \sum_{e=1}^m \sum_{f=1}^m A^{t-p}_{e,f} A^{t-q}_{f,e}$$

$$(e) = \sum_{p=1}^t \sum_{q=1}^t u_p w_q \sum_{e=1}^m \sum_{f=1}^m A^{t-p}_{f,e} A^{t-q}_{f,e}$$

$$(f) = \sum_{p=1}^t \sum_{q=1}^t u_p w_q \sum_{g=1}^{m^2} \text{pows}(A)_{g,p} \text{pows}(A)_{g,q}$$

$$(g) = \sum_{p=1}^t \sum_{q=1}^t u_p w_q (\text{pows}(A)^T \text{pows}(A))_{p,q}$$

$$(h) = \sum_{p=1}^t u_p (\text{pows}(A)^T \text{pows}(A) \text{mat}_t(w))_p$$

$$(i) = \text{mat}_t(u)^T \text{pows}(A)^T \text{pows}(A) \text{mat}_t(w)$$

2.69 Procedure 69

2.69.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \deg(\text{last}_A)$. Choose a $\mathbb{Q}[x]$ u such that $\deg(u) < t$. The objective of the following instructions is to show that $\text{tr}(u(A) \text{sel}_A(A)) = \frac{x^{t-1} \circ u}{x^t \circ \text{last}_A}$.

2.69.2 Implementation

1. Using [procedure 68](#) and [procedure 67](#), verify that $\text{tr}(u(A) \text{sel}_A(A))$

$$(a) = \text{mat}(u)^T \text{pows}(A)^T \text{pows}(A) \text{mat}_t(\text{sel}_A)$$

$$(b) = \frac{\text{mat}(u)^T \text{pows}(A)^T \text{pows}(A) ((\text{pows}(A)^T \text{pows}(A)) \setminus e_1)}{x^t \circ \text{last}_A}$$

$$(c) = \frac{\text{mat}(u)^T e_1}{x^t \circ \text{last}_A}$$

$$(d) = \frac{\text{mat}(u)_{1,1}}{x^t \circ \text{last}_A}$$

$$(e) = \frac{x^{t-1} \circ u}{x^t \circ \text{last}_A}.$$

2.70 Procedure 70

2.70.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to either show that $0 \neq 0$ or construct $\mathbb{Q}[x]$ s u, v such that $u \text{last}_A + v \text{sel}_A = 1$.

2.70.2 Implementation

1. Let $t = \deg(\text{last}_A)$.

2. Let G be a $\mathcal{M}_{1,2}(\mathbb{Q}[x])$ where $G_{1,1} = \text{last}_A$ and $G_{1,2} = \text{sel}_A$.

3. Execute [procedure 21](#) on G and let the tuple $\langle M, D, \cdot, N \rangle$ receive.

4. Verify that $G = M^{-1} \cdot D N^{-1} \cdot$.

5. Verify that $\text{last}_A \neq 0$.

6. Therefore verify that $D_{1,1} \neq 0$.

7. If $\deg(D_{1,1}) > 0$, then do the following:

$$(a) \text{ Let } b = N^{-1} \cdot_{1,1}.$$

$$(b) \text{ Verify that } \text{last}_A = b D_{1,1}.$$

$$(c) \text{ Let } z = \deg(b).$$

$$(d) \text{ Verify that } t = \deg(\text{last}_A) = \deg(b D_{1,1}) = \deg(b) + \deg(D_{1,1}) > \deg(b) = z.$$

$$(e) \text{ Let } c = N^{-1} \cdot_{1,2}.$$

$$(f) \text{ Verify that } \text{sel}_A = c D_{1,1}.$$

$$(g) \text{ Let } u = x^{t-z-1} b.$$

- (h) Execute [procedure 69](#) on A and u .

- (i) Hence verify that $\text{tr}(u(A) \text{sel}_A(A)) = x^{t-1} \circ u = x^z \circ b \neq 0$.

$$\begin{aligned} (j) \text{ Also verify that } \text{tr}(u(A) \text{sel}_A(A)) &= \\ \text{tr}(A^{z-1} b(A) c(A) D_{1,1}(A)) &= \\ \text{tr}(A^{z-1} c(A) b(A) D_{1,1}(A)) &= \\ \text{tr}(A^{z-1} c(A) \text{last}_A(A)) &= \\ \text{tr}(A^{z-1} c(A) 0_{m \times m}) &= \text{tr}(0_{m \times m}) = 0. \end{aligned}$$

- (k) Therefore verify that $0 \neq 0$.

- (l) **Abort procedure.**

8. Otherwise, do the following:

$$(a) \text{ Verify that } \deg(D_{1,1}) = 0.$$

$$(b) \text{ Let } u = \frac{N_{1,1}}{D_{1,1}}.$$

- (c) Let $v = \frac{N_{2,1}}{D_{1,1}}$.
- (d) **Verify that** $u \text{ last}_A + v \text{ sel}_A = 1$.
- (e) **Yield the tuple** $\langle u, v \rangle$.

2.71 Procedure 71 (Euclidean division)

2.71.1 Objective

Choose two $\mathbb{Q}[x]$ s, $\langle a, b \rangle$. The objective of the following instructions is to construct two $\mathbb{Q}[x]$ s u, w such that $a = ub + w$ and $\deg(w) < \deg(b)$.

2.71.2 Implementation

1. If $\deg(a) \geq \deg(b)$:
 - (a) Let $y = \frac{x^{\deg(a)} \circ a}{x^{\deg(b)} \circ b} x^{\deg(a) - \deg(b)}$
 - (b) Let $e = a - yb$.
 - (c) Verify that $\deg(e) < \deg(a)$.
 - (d) Execute **procedure 71** on the tuple $\langle e, b \rangle$.
Let the tuple $\langle c, d \rangle$ receive the result.
 - (e) Verify that $cb + d = e$.
 - (f) Verify that $\deg(d) < \deg(b)$.
 - (g) Therefore verify that $cb + d = a - yb$
 - (h) **Therefore verify that** $(y + c)b + d = a$.
 - (i) **Also verify that** $\deg(d) < \deg(b)$.
 - (j) **Now yield the tuple** $\langle y + c, d \rangle$.
2. Otherwise:
 - (a) **Verify that** $0 * b + a = a$.
 - (b) **Verify that** $\deg(a) < \deg(b)$.
 - (c) **Yield the tuple** $\langle 0, a \rangle$.

2.72 Procedure 72

2.72.1 Objective

Choose two lists of $\mathbb{Q}[x]$ s s, q and a non-negative integer k in such a way that, letting $m = |s| - 1$,

1. $k < m$.

2. For $k \leq i \leq m$, $\deg(s_i) = i$.
3. For $k < i < m$, $s_{i-1} + s_{i+1} = q_i s_i$.

Let $\deg(0) = -1$. The objective of the following instructions is to construct $\mathbb{Q}[x]$ s g, h such that $s_k = gs_{m-1} + hs_m$, $\deg(g) = m - 1 - k$, and $\deg(h) = m - 2 - k$.

2.72.2 Implementation

1. If $k < m - 2$, do the following:
 - (a) Verify that $s_k + s_{k+2} = q_{k+1}s_{k+1}$.
 - (b) Therefore verify that $s_k = q_{k+1}s_{k+1} - s_{k+2}$.
 - (c) Execute **procedure 72** on $s, q, k + 1$ and let the tuple $\langle g_1, h_1 \rangle$ receive.
 - (d) Verify that $s_{k+1} = g_1 s_{m-1} + h_1 s_m$.
 - (e) Verify that $\deg(g_1) = m - 1 - (k + 1) = m - k - 2$.
 - (f) Verify that $\deg(h_1) = m - 2 - (k + 1) = m - k - 3$.
 - (g) Execute **procedure 72** on $s, q, k + 2$ and let the tuple $\langle g_2, h_2 \rangle$ receive.
 - (h) Verify that $s_{k+2} = g_2 s_{m-1} + h_2 s_m$.
 - (i) Verify that $\deg(g_2) = m - 1 - (k + 2) = m - k - 3$.
 - (j) Verify that $\deg(h_2) = m - 2 - (k + 2) = m - k - 4$.
 - (k) Let $g = q_{k+1}g_1 - g_2$.
 - (l) **Verify that** $\deg(g) = \max(1 + (m - k - 2), m - k - 3) = m - 1 - k$.
 - (m) Let $h = q_{k+1}h_1 - h_2$.
 - (n) **Verify that** $\deg(h) = \max(1 + (m - k - 3), m - k - 4) = m - 2 - k$.
 - (o) **Verify that** $s_k = q_{k+1}(g_1 s_{m-1} + h_1 s_m) - (g_2 s_{m-1} + h_2 s_m) = (q_{k+1}g_1 - g_2)s_{m-1} + (q_{k+1}h_1 - h_2)s_m = gs_{m-1} + hs_m$.
2. Otherwise, if $k = m - 2$ do the following:
 - (a) Verify that $s_{m-2} + s_m = q_{m-1}s_{m-1}$.
 - (b) Let $g = q_{m-1}$.
 - (c) **Verify that** $\deg(g) = 1 = m - 1 - k$.
 - (d) Let $h = -1$.

- (e) **Verify that** $\deg(h) = 0 = m - 2 - k$.
 - (f) **Therefore verify that** $s_k = s_{m-2} = q_{m-1}s_{m-1} - s_m = gs_{m-1} + hs_m$.
3. Otherwise, if $k = m - 1$ do the following:
- (a) Let $g = 1$.
 - (b) **Verify that** $\deg(g) = 0 = m - 1 - k$.
 - (c) Let $h = 0$.
 - (d) **Verify that** $\deg(h) = -1 = m - 2 - k$.
 - (e) **Verify that** $s_k = s_{m-1} = gs_{m-1} + hs_m$.
4. **Yield the tuple** $\langle g, h \rangle$.

2.73 Procedure 73 (Edwards' Sturm chain construction)

2.73.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \deg(\text{last}_A)$. The objective of the following instructions is to construct lists of $\mathbb{Q}[x]$ s s, q such that

- 1. For $i = 0$ to $i = t$, $\deg(s_i) = i$.
- 2. For $i = 0$ to $i = t$, $x^i \circ s_i > 0$.
- 3. For $i = 1$ to $i = t - 1$, $s_{i-1} + s_{i+1} = q_i s_i$.
- 4. $s_t = \text{last}_A$.

2.73.2 Implementation

- 1. Execute **procedure 70** on A and let $\langle u, s_{t+1} \rangle$ receive the result.
- 2. Verify that $us_t + s_{t+1} \text{sel}_A = 1$.
- 3. Execute **procedure 71** on the tuple $\langle s_{t+1}, s_t \rangle$. Let the tuple $\langle q_t, s_{t-1} \rangle$ receive the result.
- 4. Verify that $s_{t+1} = q_t s_t + s_{t-1}$, where $\deg(s_{t-1}) < \deg(s_t) = t$.
- 5. Therefore verify that $us_t + (q_t s_t + s_{t-1}) \text{sel}_A = 1$.
- 6. Therefore verify that $s_{t-1}(A) \text{sel}_A(A) = u(A)s_t(A) + (q_t(A)s_t(A) + s_{t-1}(A)) \text{sel}_A(A) = I_{m,m}$.
- 7. Therefore using **procedure 69**, verify that $\frac{x^{t-1} \circ s_{t-1}}{x^t \circ s_t} = \text{tr}(s_{t-1}(A) \text{sel}_A(A)) = \text{tr}(I_{m,m}) = m > 0$.

- 8. For $i = t - 1$ down to $i = 1$, do the following:
 - (a) Execute **procedure 71** on the tuple $\langle -s_{i+1}, -s_i \rangle$. Let the tuple $\langle q_i, s_{i-1} \rangle$ receive the result.
 - (b) Verify that $\deg(q_i) = 1$.
 - (c) Verify that $x \circ q_i = \frac{x^{i+1} \circ s_{i+1}}{x^i \circ s_i}$.
 - (d) Also verify that $-s_{i+1} = -q_i s_i + s_{i-1}$.
 - (e) Therefore verify that $q_i s_i = s_{i+1} + s_{i-1}$.
 - (f) Therefore verify that $q_i s_i - s_{i+1} = s_{i-1}$.
 - (g) Execute **procedure 72** on the tuple $\langle s, q, i - 1 \rangle$ and let $\langle p, j \rangle$ receive.
 - (h) Verify that $s_{i-1} = ps_{t-1} + q_3 s_t$.
 - (i) Verify that $\deg(p) = t - 1 - (i - 1) = t - i$.
 - (j) Verify that $\deg(q_3) = t - 2 - (i - 1) = t - 1 - i$.
 - (k) Therefore verify that $s_{i-1}(A) = p(A)s_{t-1}(A) + j(A)s_t(A) = p(A)s_{t-1}(A) + j(A)0_{m \times m} = p(A)s_{t-1}(A)$.
 - (l) If $p(A) = 0$, then do the following:
 - i. Execute **procedure 64** on A and p .
 - ii. **Abort procedure.**
 - (m) Otherwise, if $s_{i-1}(A) = 0_{m \times m}$, then do the following:
 - i. Verify that $p(A)s_{t-1}(A) \text{sel}_A(A) = s_{i-1}(A) \text{sel}_A(A) = 0_{m \times m} \text{sel}_A(A) = 0_{m \times m}$.
 - ii. Verify that $p(A)s_{t-1}(A) \text{sel}_A(A) = p(A)I_{m,m} = p(A) \neq 0_{m \times m}$.
 - iii. Therefore verify that $0 \neq 0$.
 - iv. **Abort procedure.**
 - (n) Otherwise if $s_{i-1}(A) \text{sel}_A(A) = 0_{m \times m}$, then do the following:
 - i. Verify that $s_{i-1}(A) \text{sel}_A(A)s_{t-1}(A) = 0_{m \times m}s_{t-1}(A) = 0_{m \times m}$.
 - ii. Verify that $s_{i-1}(A) \text{sel}_A(A)s_{t-1}(A) = s_{i-1}(A)I_{m,m} = s_{i-1}(A) \neq 0$.
 - iii. Therefore verify that $0 \neq 0$.
 - iv. **Abort procedure.**
 - (o) Otherwise, do the following:

- i. Verify that $\deg(s_{i-1}) < i$.
 - ii. Verify that $s_{i-1}(A) \text{sel}_A(A) \neq 0_{m \times m}$.
 - iii. Execute the **auxilliary procedure** on the tuple $(i-1, s_{i-1})$.
 - iv. Hence verify that
$$\begin{aligned} \frac{x^{i-1} \circ s_{i-1}}{x^i \circ s_i} &= \\ \text{tr}(s_{i-1}(A)^2 \text{sel}_A(A)^2) &= \\ \text{tr}((s_{i-1}(A) \text{sel}_A(A))^2) &= \\ \|s_{i-1}(A) \text{sel}_A(A)\|^2 &> 0. \end{aligned}$$
 - v. **Therefore verify that** $\text{sgn}(x^{i-1} \circ s_{i-1}) = \text{sgn}(x^i \circ s_i)$.
9. Yield the tuple $\langle s_{[0:t+1]}, q_{[0:t]} \rangle$.

2.73.3 Auxilliary procedure

Objective Choose an integer $0 \leq k \leq t$ such that polynomial s_k is defined. Choose a $\mathbb{Q}[x]$ g such that $\deg(g) \leq \min(k, t-1)$. The objective of the following instructions is to show that $\text{tr}(g(A)s_k(A) \text{sel}_A(A)^2) = \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$.

Implementation

1. If $k = t$, then verify that $\text{tr}(g(A)s_k(A) \text{sel}_A(A)^2)$
 - (a) $= \text{tr}(g(A)s_t(A) \text{sel}_A(A)^2)$
 - (b) $= \text{tr}(g(A)0_{m \times m} \text{sel}_A(A)^2)$
 - (c) $= 0$
 - (d) $= \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$.
2. Otherwise if $k = t-1$, then verify that $\text{tr}(g(A)s_k(A) \text{sel}_A(A)^2)$
 - (a) $= \text{tr}(g(A)s_{t-1}(A) \text{sel}_A(A)^2)$.
 - (b) $= \text{tr}(g(A)I_{m,m} \text{sel}_A(A))$.
 - (c) $= \text{tr}(g(A) \text{sel}_A(A))$.
 - (d) $= \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$.
3. Otherwise if $k < t-1$, then do the following:
 - (a) Verify that $\deg(gq_{k+1}) = k+1 \leq t-1$.
 - (b) Execute the **auxilliary procedure** on the tuple $\langle k+1, gq_{k+1} \rangle$.

- (c) Now verify that
$$\begin{aligned} \text{tr}((g(A)q_{k+1}(A))s_{k+1}(A) \text{sel}_A(A)^2) &= \\ \frac{x^{k+2} \circ s_{k+2} x^k \circ g}{x^{k+1} \circ s_{k+1}} &= \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}. \end{aligned}$$
- (d) Verify that $\deg(g) \leq k \leq t-2$.
- (e) Execute the **auxilliary procedure** on the tuple $\langle k+2, g \rangle$.
- (f) Now verify that
$$\begin{aligned} \text{tr}(g(A)s_{k+2}(A) \text{sel}_A(A)^2) &= \frac{x^{k+2} \circ g}{x^{k+3} \circ s_{k+3}} = \\ \frac{0}{x^{k+3} \circ s_{k+3}} &= 0. \end{aligned}$$
- (g) Therefore verify that
 - i. $= \text{tr}(g(A)(q_{k+1}(A)s_{k+1}(A) + s_{k+2}(A)) \text{sel}_A(A)^2)$
 - ii. $= \text{tr}(g(A)q_{k+1}(A)s_{k+1}(A) \text{sel}_A(A)^2) + \text{tr}(g(A)s_{k+2}(A) \text{sel}_A(A)^2)$
 - iii. $= \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}} + 0$
 - iv. $= \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$.

2.74 Procedure 74

2.74.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \deg(\text{last}_A)$. The objective of the following instructions is to either show that $0 < 0$ or to construct two lists of rational numbers c, d such that $c_1 < d_1 \leq c_2 < d_2 \leq \dots \leq c_t < d_t$ and $\text{sgn}(\text{last}_A(c_i)) = -\text{sgn}(\text{last}_A(d_i))$ for $i = 1$ to $i = t$.

2.74.2 Implementation

1. Execute **procedure 73** on the matrix A and let the tuple $\langle s, q \rangle$ receive the result.
2. Execute **procedure 60** supplying the tuple $\langle s, q \rangle$. Let the tuple $\langle c, d \rangle$ receive the result.
3. **Verify that** $c_1 < d_1 \leq c_2 < d_2 \leq \dots \leq c_t < d_t$.
4. **Verify that** $\text{sgn}(\text{last}_A(c_i)) = -\text{sgn}(\text{last}_A(d_i))$ **for** $i = 1$ **to** $i = t$.
5. **Yield** $\langle c, d \rangle$.

2.75 Procedure 75

2.75.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Let $t = \deg(\text{last}_A)$. Execute **procedure 74** on A and let the tuple $\langle c, d \rangle$ receive the result. Execute **procedure 21** on A and let the tuple $\langle, , u, \rangle$ receive the result. The objective of the following instructions is to either show that $1 = -1$ or to construct a list of non-negative integers k such that $\text{sgn}(u_{k_i}(c_i)) = -\text{sgn}(u_{k_i}(d_i))$ for $i = 1$ to $i = t$.

2.75.2 Implementation

1. Verify that $\text{last}_A = u_1 u_2 \cdots u_m$.
2. For $i = 1$ to $i = t$ do the following:
 - (a) If $\text{sgn}(u_1(c_i)) = \text{sgn}(u_1(d_i)), \text{sgn}(u_2(c_i)) = \text{sgn}(u_2(d_i)), \dots, \text{sgn}(u_m(c_i)) = \text{sgn}(u_m(d_i))$, then do the following:
 - i. Verify that $\text{sgn}(u_1(c_i)) \text{sgn}(u_2(c_i)) \cdots \text{sgn}(u_m(c_i)) = \text{sgn}(u_1(d_i)) \text{sgn}(u_2(d_i)) \cdots \text{sgn}(u_m(d_i))$.
 - ii. Therefore verify that $\text{sgn}(u_1(c_i) u_2(c_i) \cdots u_m(c_i)) = \text{sgn}(u_1(d_i) u_2(d_i) \cdots u_m(d_i))$.
 - iii. Therefore verify that $\text{sgn}(s_t(c_i)) = \text{sgn}(s_t(d_i))$.
 - iv. Cognizant of the execution of **procedure 60**, verify that $\text{sgn}(s_t(c_i)) = -\text{sgn}(s_t(d_i))$.
 - v. Therefore verify that $\text{sgn}(s_t(c_i)) = -\text{sgn}(s_t(d_i))$.
 - vi. Therefore verify that $1 = -1$.
 - vii. **Abort procedure.**
 - (b) Otherwise do the following:
 - i. Let j be the least integer such that $\text{sgn}(u_j(c_i)) = -\text{sgn}(u_j(d_i))$.
 - ii. Let $k_i = j$.
3. Yield $\langle k \rangle$.

2.76 Procedure 76

2.76.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute **procedure 21** on A and let the tuple $\langle, , u, \rangle$ receive the result. Execute **procedure 55** on A and let k receive. Let $t = \deg(\text{last}_A)$. Let $n_j = \sum_{i=1}^t [k_i = j]$. The objective of the following instructions is to either show that $0 < 0$, or to show that $n_i = \deg(u_i)$ for $i = 1$ to $i = m$.

2.76.2 Implementation

1. Verify that $\sum_{j=1}^m n_j = \sum_{j=1}^m \sum_{i=1}^t [k_i = j] = \sum_{i=1}^t \sum_{j=1}^m [k_i = j] = \sum_{i=1}^t 1 = t$.
2. If for any $i = 1$ to $i = m$, $n_i > \deg(u_i)$, then do the following:
 - (a) Execute **procedure 55** on the polynomial u_i along with $\deg(u_i) + 1$ of the distinct pairs $\langle c_l, d_l \rangle$ such that $k_l = i$.
 - (b) **Abort procedure.**
3. Otherwise if for any $i = 1$ to $i = m$, $n_i < \deg(u_i)$, then do the following:
 - (a) Verify that $\sum_{i=1}^m n_j < \sum_{i=1}^m \deg(u_j) = t$.
 - (b) Therefore verify that $\sum_{i=1}^m n_j < \sum_{i=1}^m n_j$.
 - (c) **Abort procedure.**
4. Otherwise, do the following:
 - (a) **For all $i = 1$ to $i = m$, verify that $n_i = \deg(u_i)$.**

Let us use the notation " A is upper triangular" as a shorthand for "all the entries of A below the diagonal are zero" in what follows.

2.77 Procedure 77 (Upper triangular matrix multiplication)

2.77.1 Objective

Choose two upper triangular $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ s, A and B . Let $C = AB$. The objective of the following instructions is to show that C is an upper triangular matrix where $C_{i,i} = A_{i,i} B_{i,i}$ for $i = 1$ to $i = m$.

2.77.2 Implementation

1. For $i = 1$ to $i = m$, do the following:
 - (a) **Verify that** $C_{i,i} = \sum_{k=1}^m (A_{i,k}B_{k,i}) = \sum_{k=1}^{i-1} (A_{i,k}B_{k,i}) + A_{i,i}B_{i,i} + \sum_{k=i+1}^m (A_{i,k}B_{k,i}) = \sum_{k=1}^{i-1} (0 * B_{k,i}) + A_{i,i}B_{i,i} + \sum_{k=i+1}^m (A_{i,k} * 0) = A_{i,i}B_{i,i}$.
2. For $i = 2$ to $i = m$, do the following:
 - (a) For $j = 1$ to $j = i - 1$, do the following:
 - i. Verify that $C_{i,j} = \sum_{k=1}^m A_{i,k}B_{k,j} = \sum_{k=1}^{i-1} A_{i,k}B_{k,j} + \sum_{k=i}^m A_{i,k}B_{k,j} = \sum_{k=1}^{i-1} 0 * B_{k,j} + \sum_{k=i}^m A_{i,k} * 0 = 0$.
3. **Therefore verify that C is upper triangular.**

2.78 Procedure 78

2.78.1 Objective

Choose integers $m \geq n \geq 0$. Choose a $\mathcal{M}_{n,m}(\mathbb{Q}[x])$, M , and a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A_0 , such that $MA_0 = I_n$. The objective of the following instructions is to either show that $1 = 0$ or to define the $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ s A_1, A_2, \dots, A_n .

2.78.2 Implementation

1. Using **procedure 11**, verify that $C_n(M_0A_0) = C_n(I_n) = 1$.
2. If $C_n(A_0) = 0_{\binom{m}{n} \times 1}$, then do the following:
 - (a) Verify that $C_n(M_0A_0) = C_n(M_0)C_n(A_0) = C_n(M_0)0_{\binom{m}{n} \times 1} = 0$.
 - (b) **Therefore verify that $1 = 0$.**
 - (c) **Abort procedure.**
3. Verify that $C_n(A_0) \neq 0_{\binom{m}{n} \times 1}$.
4. For $i = 1$ to $i = n$, do the following:
 - (a) If $A_{i-1}e_i = 0_{m \times 1}$, then do the following:
 - i. Verify that $C_n(A_{i-1}) = 0$.
 - ii. Cognizant of the execution of the previous iteration, verify that $C_n(A_{i-1}) \neq 0$.
 - iii. **Therefore verify that $0 \neq 0$.**

iv. Abort procedure.

- (b) Verify that $\|A_{i-1}e_i\|^2 \neq 0$.
- (c) Let D_i be a $n \times n$ diagonal matrix comprising i 1s followed by $n - i$ $\|A_{i-1}e_i\|^2$ s.
- (d) Verify that $C_n(D_i) = (\|A_{i-1}e_i\|^2)^{n-i} \neq 0$.
- (e) Let $N_i = I_n$ except that its i^{th} row is $i - 1$ 0s followed by a 1 followed by $-(A_{i-1}^T A_{i-1})_{i,i+1}$, then $-(A_{i-1}^T A_{i-1})_{i,i+2}$, all the way up to $-(A_{i-1}^T A_{i-1})_{i,n}$.
- (f) Using **procedure 11**, verify that $C_n(N_i) = 1 \neq 0$.
- (g) Let $A_i = A_{i-1}D_iN_i$.
- (h) **Verify that** $C_n(A_i) = C_n(A_{i-1}D_iN_i) = C_n(A_{i-1})C_n(D_i)C_n(N_i) = C_n(A_{i-1})C_n(D_i) \neq 0$.

5. **Yield the tuple $\langle A_0, A_1, \dots, A_n \rangle$.**

2.79 Procedure 79

2.79.1 Objective

Choose integers $m \geq n \geq 0$. Choose a $\mathcal{M}_{n,m}(\mathbb{Q}[x])$, M , and a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A_0 , such that $MA_0 = I_n$. Execute **procedure 78** on M and A_0 and let the tuple $\langle A_1, \dots, A_n \rangle$ receive the result. The objective of the following instructions is to either show that $1 = 0$ or to show that $(A_i^T A_i)_{[1:i+1],[1:i+1]}$ is a $\mathcal{D}_{i,i}(\mathbb{Q}[x])$ for $i = 1$ to $i = n$.

2.79.2 Implementation

1. For $i = 1$ to $i = n$, do the following:
 - (a) Let D_i be a $n \times n$ diagonal matrix comprising i 1s followed by $n - i$ $\|A_{i-1}e_i\|^2$ s.
 - (b) Let $N_i = I_n$ except that its i^{th} row is $i - 1$ 0s followed by a 1 followed by $-(A_{i-1}^T A_{i-1})_{i,i+1}$, then $-(A_{i-1}^T A_{i-1})_{i,i+2}$, all the way up to $-(A_{i-1}^T A_{i-1})_{i,n}$.
 - (c) Verify that $A_i = A_{i-1}D_iN_i$.
 - (d) Verify that $A_i^T A_i = (A_{i-1}D_iN_i)^T (A_{i-1}D_iN_i) = N_i^T D_i^T (A_{i-1}^T A_{i-1}) D_i N_i$.

- (e) Now verify that $A_i^T A_i$ and $A_{i-1}^T A_{i-1}$ are the same modulo the bottom-right $(n-i+1) \times (n-i+1)$ block.
- (f) Also verify that $(A_i^T A_i)_{i,[i+1:n+1]} = 0$.
- (g) Also verify that $(A_i^T A_i)_{[i+1:n+1],i} = 0$.
- (h) **Therefore** **verify** **that**
 $(A_i^T A_i)_{[1:i+1],[1:i+1]}$ **is a** $\mathcal{D}_{i,i}(\mathbb{Q}[x])$.

2.80 Procedure 80

2.80.1 Objective

Choose integers $m \geq n \geq 0$. Choose a $\mathcal{M}_{n,m}(\mathbb{Q}[x])$, M , and a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A_0 , such that $MA_0 = I_n$. Execute **procedure 78** on M and A_0 and let the tuple $\langle A_1, \dots, A_n \rangle$ receive the result. The objective of the following instructions is to either show that $1 = 0$ or to show that $A_0 M A_i = A_i$ and $(e_j^T M)(A_i e_j) = \|A_0 e_1\|^2 \cdots \|A_{\min(i,j-1)-1} e_{\min(i,j-1)}\|^2$ for $j = 1$ to $j = n$, for $i = 1$ to $i = n$.

2.80.2 Implementation

1. For $i = 1$ to $i = n$, do the following:
 - (a) Let D_i be a $n \times n$ diagonal matrix comprising i 1s followed by $n-i$ $\|A_{i-1} e_i\|^2$ s.
 - (b) **Verify that D_i is upper triangular.**
 - (c) Let $N_i = I_n$ except that its i^{th} row is $i-1$ 0s followed by a 1 followed by $-(A_{i-1}^T A_{i-1})_{i,i+1}$, then $-(A_{i-1}^T A_{i-1})_{i,i+2}$, all the way up to $-(A_{i-1}^T A_{i-1})_{i,n}$.
 - (d) **Verify that N_i is upper triangular.**
 - (e) Verify that $A_i = A_{i-1} D_i N_i$.
 - (f) Verify that $A_i = A_0 (D_1 N_1) \cdots (D_i N_i)$.
 - (g) Verify that $MA_i = (D_1 N_1) \cdots (D_i N_i)$.
 - (h) **Therefore verify that $A_0 M A_i = A_i$.**
 - (i) Using **procedure 77**, for $j = 1$ to $j = n$, verify that $(e_j^T M)(A_i e_j)$
 - i. $= e_j^T (M A_i) e_j$
 - ii. $= e_j^T ((D_1 N_1) \cdots (D_i N_i)) e_j$
 - iii. $= (D_{1,j,j} N_{1,j,j}) \cdots (D_{i,j,j} N_{i,j,j})$

- iv. $= D_{1,j,j} \cdots D_{i,j,j}$
- v. $= D_{1,j,j} \cdots D_{\min(i,j-1),j,j}$
- vi. $= \|A_0 e_1\|^2 \cdots \|A_{\min(i,j-1)-1} e_{\min(i,j-1)}\|^2$.

2.81 Procedure 81 (Cauchy-Schwarz inequality)

2.81.1 Objective

Choose a $\mathcal{M}_{1,m}(\mathbb{Q})$, A , and a $\mathcal{M}_{m,1}(\mathbb{Q})$, B . The objective of the following instructions is to show that $(AB)^2 \leq (AA^T)(B^T B)$.

2.81.2 Implementation

1. Verify that 0
 - (a) $\leq \frac{1}{2} \sum_{i=1}^m \sum_{j=1}^m (A_i B_j - A_j B_i)^2$
 - (b) $= \frac{1}{2} \sum_{i=1}^m \sum_{j=1}^m (A_i^2 B_j^2 - 2A_i B_j A_j B_i + A_j^2 B_i^2)$
 - (c) $= \frac{1}{2} \sum_{i=1}^m A_i^2 \sum_{j=1}^m B_j^2 + \frac{1}{2} \sum_{i=1}^m B_i^2 \cdot \sum_{j=1}^m A_j^2 - \sum_{i=1}^m A_i B_i \sum_{j=1}^m A_j B_j$
 - (d) $= \frac{1}{2} (AA^T)(B^T B) + \frac{1}{2} (AA^T)(B^T B) - (AB)^2$
 - (e) $= (AA^T)(B^T B) - (AB)^2$.
2. **Therefore verify that $(AB)^2 \leq (AA^T)(B^T B)$.**

2.82 Procedure 82

2.82.1 Objective

Choose integers $m \geq n > 0$. Choose a $\mathcal{M}_{n,m}(\mathbb{Q}[x])$, M , and a $\mathcal{M}_{m,n}(\mathbb{Q}[x])$, A_0 , such that $MA_0 = I_n$. Choose a \mathbb{Q} , x . Let $a = \max(\|M(x)\|^2, 1)$. Choose a column index $1 \leq j \leq n$ such that $\|A_n(x) e_j\|^2 < \frac{1}{a^{(2n+2)!!}}$. The objective of the following instructions is to show that $1 < 1$.

2.82.2 Implementation

1. Execute **procedure 78** on M and A_0 and let the tuple $\langle A_0, A_1, \dots, A_n \rangle$ receive the result.
2. Let $i = n$.
3. Verify that $\|A_i(x) e_j\|^2 < \frac{1}{a^{(2i+2)!!}}$.

4. Using **procedure 81**, verify that $(e_j^T M(x) A_i(x) e_j)^2 \leq \|e_j^T M(x)\|^2 \|A_i(x) e_j\|^2 < \|M(x)\|^2 \frac{1}{a^{(2i+2)!}} \leq a \frac{1}{a^{(2i+2)!}} \leq \frac{1}{a^{(2i)! * 2i}} \leq 1$.

5. If $i = 0$, then do the following:

- Verify that $(e_j^T M(x) A_i(x) e_j)^2 = (e_j^T M(x) A_0(x) e_j)^2 = (e_j^T I_n e_j)^2 = 1$.
- Therefore verify that $1 < 1$.
- Abort procedure.**

6. Otherwise, do the following:

7. Using **procedure 80**, verify that $(1 \|A_0 e_1\|^2 \cdots \|A_{\min(i,j-1)-1} e_{\min(i,j-1)}\|^2)^2 = (e_j^T M(x) A_i(x) e_j)^2 < \frac{1}{a^{(2i)! * 2i}} \leq 1$.

8. If $\min(i, j-1) = 0$, then do the following:

- Verify that $(1 \|A_0(x) e_1\|^2 \cdots \|A_{\min(i,j-1)-1}(x) e_{\min(i,j-1)}\|^2)^2 = 1^2 = 1$.
- Therefore verify that $1 < 1$.
- Abort procedure.**

9. Otherwise do the following:

- Verify that $\min(i, j-1) > 0$.
- If for all $k = 0$ to $k = \min(i, j-1) - 1$, $\|A_k(x) e_{k+1}\|^2 \geq \frac{1}{a^{(2i)!}}$, then do the following:
 - Verify that $(e_j^T M(x) A_i(x) e_j)^2 = (\|A_0(x) e_1\|^2 \cdots \|A_{\min(i,j-1)-1}(x) e_{\min(i,j-1)}\|^2)^2 \geq (\frac{1}{a^{(2i)!}})^{2 \min(i,j-1)} \geq (\frac{1}{a^{(2i)!}})^{2i} = \frac{1}{a^{(2i)! * 2i}}$.
 - Therefore verify that $(e_j^T M(x) A_i(x) e_j)^2 < \frac{1}{a^{(2i)! * 2i}} \leq (e_j^T M(x) A_i(x) e_j)^2$.
 - Abort procedure.**

- (c) Otherwise, do the following:

- Let k , where $0 \leq k < i$, be one of the integers for which $\|A_k(x) e_{k+1}\|^2 < \frac{1}{a^{(2i)!}}$.
- Verify that $\|A_k(x) e_{k+1}\|^2 < \frac{1}{a^{(2i)!}} \leq \frac{1}{a^{(2k+2)!}}$.
- Simultaneously set i to k and j to $k+1$.

iv. **Go to (3).**

2.83 Procedure 83

2.83.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Execute **procedure 75** on the matrix A and let the tuple $\langle k \rangle$ receive the result. The objective of the following instructions is to show that $\sum_{i=1}^t (m+1-k_i) = m$.

2.83.2 Implementation

- Execute **procedure 21** on the matrix A and let the tuple $\langle D, u, \rangle$.

- Using **procedure 76**, verify that $\sum_{i=1}^t (m+1-k_i)$

- $= \sum_{i=1}^t \sum_{j=1}^m [k_i \leq j]$
- $= \sum_{j=1}^m \sum_{i=1}^t [k_i \leq j]$
- $= \sum_{j=1}^m \sum_{i=1}^t [k_i \leq j] \sum_{l=1}^m [k_i = l]$
- $= \sum_{j=1}^m \sum_{l=1}^m \sum_{i=1}^t [k_i \leq j] [k_i = l]$
- $= \sum_{j=1}^m \sum_{l=1}^m [l \leq j] [k_i = l]$
- $= \sum_{j=1}^m \sum_{l=1}^m [l \leq j] \deg u_l$
- $= \sum_{j=1}^m \sum_{l=1}^j \deg u_l$
- $= \sum_{j=1}^m \deg D_{j,j}$
- $= m$

2.84 Procedure 84

2.84.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . The objective of the following instructions is to define the rational $\text{disc}(A)$.

2.84.2 Implementation

- Execute **procedure 74** on the matrix A and let the tuple $\langle c, d \rangle$ receive the result.

2. Execute **procedure 5** with $xI_m - A$ as the choice matrix. Let the tuple $\langle M, D, , N \rangle$ receive the result.
3. Let $L = |(\|N^{-1}\|^2)^{(2m+2)!!}|$.
4. Let $\text{disc}(A) = \frac{1}{\max(1, L(|c_1|), L(|d_t|))}$.
5. **Verify that** $\text{disc}(A) > 0$.
6. **Yield the tuple** $\langle \text{disc}(A) \rangle$.

Let us use the notation $\text{disc}(A)$ to refer to the invocation of **procedure 84** on the matrix A .

2.85 Procedure 85

2.85.1 Objective

Choose integers $0 < k \leq m$ and a list of $\mathcal{T}_m(\mathbb{Q}[x])$, N . Let $Q = (I_m)_{*, [k:m]}$. The objective of the following instructions is to construct an $\mathcal{M}_{m, m+1-k}(\mathbb{Q}[x])$, K , and an $\mathcal{M}_{m+1-k, m+1-k}(\mathbb{Q}[x])$, E , such that $K_i = NQE$ and $K^T K$ is a $\mathcal{D}_{m+1-k, m+1-k}(\mathbb{Q}[x])$.

2.85.2 Implementation

1. Verify that $(Q^T N^{-1})(NQ) = Q^T (N^{-1} N) Q = Q^T I_m Q = Q^T Q = I_{m+1-k}$.
2. Execute **procedure 78** on the matrices $Q^T N^{-1}$ and NQ . Let the tuple $\langle , \dots , K \rangle$ receive the result.
3. **Verify that** K is a $\mathcal{M}_{m, m+1-k}(\mathbb{Q}[x])$.
4. **Using procedure 79, verify that** $K^T K$ is a $\mathcal{D}_{m+1-k, m+1-k}(\mathbb{Q}[x])$.
5. Let $E = Q^T N^{-1} K$.
6. **Verify that** E is a $\mathcal{M}_{m+1-k, m+1-k}(\mathbb{Q}[x])$.
7. Execute **procedure 80** on the matrices $Q^T N^{-1}$ and NQ .
8. **Now verify that** $K = NQE$.
9. **Yield** $\langle K, E \rangle$.

2.86 Procedure 86 (Symmetric matrix spectral procedure initialization)

2.86.1 Objective

Choose a symmetric $\mathcal{M}_{m, m}(\mathbb{Q})$, A . Choose a $\mathbb{Q} \epsilon > 0$. Execute **procedure 75** on the matrix A and let the tuple $\langle k \rangle$ receive the result. The objective of the following instructions is to either show that $1 < 1$ or to construct \mathbb{Q} s, $0 < \delta \leq 1 \leq K'$, a list of $\mathcal{M}_{m, * }(\mathbb{Q})$ s, K , and a list of \mathbb{Q} s, g , such that for $1 \leq i \leq |k|$:

1. $\text{cols}(K_i) = m + 1 - k_i$.
2. $(K_i)_{p, q} \leq K' m$, for $1 \leq p \leq m$, for $1 \leq q \leq \text{cols}(K_i)$.
3. $K_i^T K_i$ is a $\mathcal{D}_{*, * }(\mathbb{Q})$.
4. $(K_i^T K_i)_{j, j} \geq \text{disc}(A)$ for $1 \leq j \leq \text{cols}(K_i)$.
5. $|(g_i K_i - A K_i)_{p, q}| < \frac{\epsilon \delta}{K' m^2}$, for $1 \leq p \leq m$, for $1 \leq q \leq \text{cols}(K_i)$.
6. $\delta \leq \min_{1 \leq i \neq j \leq |g|} |g_j - g_i|$.

2.86.2 Implementation

1. Execute **procedure 74** on the matrix A and let the tuple $\langle c, d \rangle$ receive the result.
2. Execute **procedure 21** with $xI_m - A$ as the choice matrix. Let the tuple $\langle M, D, u, N \rangle$ receive the result.
3. Let $M' = 1 + \max_{i=1}^m \max_{j=1}^m |M^{-1}_{*, i, j}| (\max(|c_1|, |d_{|d|}|))$.
4. Let $N' = 1 + \max_{i=1}^m \max_{j=1}^m |N_{*, i, j}| (\max(|c_1|, |d_{|d|}|))$.
5. Let $\delta = \min(1, \min_{i=1}^{|d|-1} (d_{i+1} - c_i))$.
6. Execute **procedure 85** on $\langle k, m, N \rangle$ and let the tuple $\langle \langle K_1, E_1 \rangle, \langle K_2, E_2 \rangle, \dots, \langle K_{|k|}, E_{|k|} \rangle \rangle$ receive.
7. **Using procedure 83, verify that** $\sum_{p=1}^{|k|} \text{cols}(K_p) = \sum_{p=1}^{|k|} m + 1 - k_p = m$.
8. Let $E' = 1 + \max_{i=1}^t \max_{j=1}^{m+1-k_i} \max_{l=1}^{m+1-k_i} |E_{j, l}| (\max(|c_1|, |d_{|d|}|))$.
9. Let $U = (1 + |u_1|)(1 + |u_2|) \dots (1 + |u_m|)$.
10. Let $U' = U(\max(|c_1|, |d_{|d|}|))$.
11. Let $b = \frac{\epsilon \delta}{M' N' E'^2 m^3}$.

12. For $i = 1$ to $i = |k|$, do the following:

- (a) Verify that $\text{sgn}(u_{k_i}(c_i)) \neq \text{sgn}(u_{k_i}(d_i))$.
- (b) Execute **procedure 54** on the formal polynomial u_{k_i} , interval (c_i, d_i) , and target of $\frac{b}{U'}$. Let $\langle g_i \rangle$ receive the result.
- (c) Now verify that $|u_{k_i}(g_i)| < \frac{b}{U'}$.
- (d) Also verify that $c_i \leq g_i \leq d_i$.
- (e) For $j = k_i$ to $j = m$, do the following:
 - i. Verify that $|D_{j,j}(g_i)| = |u_1(g_i)| |u_2(g_i)| \cdots |u_m(g_i)|$
 $|u_{k_i}(g_i)| |u_1(g_i)| \cdots |u_{k_i-1}(g_i)|$
 $|u_{k_i+1}(g_i)| \cdots |u_m(g_i)|$
 $\frac{b}{U'} U(g_i) = \frac{b}{U'} U' = b.$
- (f) Let $Q = (I_m)_{*, [k_i:m]}$.
- (g) If a diagonal entry of $K_i(g_i)^T K_i(g_i)$ is less than $\text{disc}(A)$, then do the following:
 - i. Let z be the column index of the diagonal entry less than $\text{disc}(A)$.
 - ii. Verify that $\frac{1}{\max(\|Q^T N^{-1}(g_i)\|^2, 1)^{(2(m+1-k_i)+2)!!}}$ \leq
 - iii. Execute **procedure 82** with matrices $Q^T N^{-1}$ and NQ , rational number g_i , and column index z .
 - iv. **Abort procedure.**
- (h) Otherwise, do the following:
 - i. **For $j = 1$ to $j = m + 1 - k_i$, verify that $(K_i(g_i)^T K_i(g_i))_{j,j} \geq \text{disc}(A) > 0$.**
 - ii. Verify that $xK_i - AK_i = (xI_m - A)K_i = M^{-1}DN^{-1}K_i = M^{-1}DN^{-1}NQ E_i = M^{-1}DQE_i$.
 - iii. **Verify that $(g_i K_i(g_i) - AK_i(g_i))_{p,q} = (M^{-1}(g_i)D(g_i)QE_i(g_i))_{p,q} < M'b(m + 1 - k_i)E' = M' \frac{\epsilon \delta}{M'N'E'^2 m^3} (m + 1 - k_i)E' \leq \frac{\epsilon \delta}{N'E'm^2}$ for $1 \leq p \leq m$, for $1 \leq q \leq m + 1 - k_i$.**
 - iv. **Verify that $K_i(g_i)_{p,q} = (N(g_i)QE_i(g_i))_{p,q} = N'(m + 1 - k_i)E' \leq N'E'm$.**

13. **Yield the tuple $\langle \delta, N'E', \langle K_1(g_1), \dots, K_t(g_t) \rangle, g \rangle$.**

2.87 Procedure 87 (Symmetric matrix spectral)

2.87.1 Objective

Choose a symmetric $\mathcal{M}_{m,m}(\mathbb{Q})$, A . Choose a $\mathbb{Q} \epsilon > 0$. The objective of the following instructions is to construct an $\mathcal{M}_{m,m}(\mathbb{Q})$, K , and a $\mathcal{D}_{m,m}(\mathbb{Q})$, C , such that:

1. $\sum_{p=1}^m \sum_{q=1}^m |(KC - AK)_{p,q}| < \epsilon$.
2. $|(K^T K)_{i,j}| \leq 2\epsilon$ for $1 \leq i \neq j \leq m$.
3. $(K^T K)_{j,j} \geq \text{disc}(A) > 0$ for $1 \leq j \leq m$.

2.87.2 Implementation

1. Execute **procedure 86** on matrix A and rational ϵ . Let the tuple $\langle \delta, K', K, g \rangle$ receive the result.
2. Let C be a diagonal matrix whose i^{th} , where $1 \leq i \leq t$, group of entries are $m + 1 - k_i$ g_i s.
3. **Using procedure 83, verify that C is $m \times m$.**
4. Let K be a matrix whose columns are the in-order concatenation of those of K_1, K_2, \dots, K_t .
5. **Using procedure 83, verify that K is $m \times m$.**
6. **Using (1), verify that $\sum_{p=1}^m \sum_{q=1}^m |(KC - AK)_{p,q}| < \sum_{p=1}^m \sum_{q=1}^m \frac{\epsilon \delta}{K'm^2} = \frac{\epsilon \delta}{K'} \leq \epsilon$.**
7. For $i = 1$ to $i = m$, do the following: For $j = 1$ to $j = m$, do the following:
 - (a) Let a, c be such that Ke_i came from $K_a e_c$.
 - (b) Let b, d be such that Ke_j came from $K_b e_d$.
 - (c) If $a \neq b$, then do the following:
 - i. Using (1), verify that $|(g_b - g_a)(Ke_i)^T(Ke_j)|$
 - ii. $= |g_b(Ke_i)^T(Ke_j) - g_a(Ke_i)^T(Ke_j)|$
 - iii. $= |(Ke_i)^T(g_b Ke_j) - (g_a Ke_i)^T(Ke_j)|$
 - iv. $= |(Ke_i)^T(AKe_j + g_b Ke_j - AKe_j) - (AKe_i + g_a Ke_i - AKe_i)^T(Ke_j)|$
 - v. $\leq |(Ke_i)^T(AKe_j) - (AKe_i)^T(Ke_j)| + |(Ke_i)^T(g_b Ke_j - AKe_j)| + |(g_a Ke_i - AKe_i)^T(Ke_j)|$

$$\begin{aligned} \text{vi. } &\leq |(Ke_i)^T A(Ke_j) - (Ke_i)^T A^T(Ke_j)| + \\ &\quad |mK'J_{1 \times m} \frac{\epsilon\delta}{K'm^2} J_{m \times 1}| + \\ &\quad |\frac{\epsilon\delta}{K'm^2} J_{1 \times m} mK'J_{m \times 1}| \end{aligned}$$

$$\text{vii. } = 2\epsilon\delta.$$

$$\begin{aligned} \text{viii. } &\text{Therefore using (1) and (vii),} \\ &\text{verify that } |e_i^T(K^T K)e_j| = \\ &|(Ke_i)^T(Ke_j)| \leq \frac{2\epsilon\delta}{|g_b - g_a|} \leq 2\epsilon. \end{aligned}$$

(d) Otherwise if $c \neq d$, do the following:

$$\begin{aligned} \text{i. } &\text{Using (1), verify that } K_a^T K_b = \\ &K_a^T K_a \text{ is a } \mathcal{D}_{*,*}(\mathbb{Q}). \end{aligned}$$

$$\begin{aligned} \text{ii. } &\text{Therefore verify that} \\ &(Ke_i)^T(Ke_j) = (K_a e_c)^T(K_b e_d) = \\ &e_c^T K_a^T K_b e_d = 0 \leq 2\epsilon. \end{aligned}$$

$$\begin{aligned} 8. &\text{Therefore using (7), verify that} \\ &|(K^T K)_{i,j}| \leq 2\epsilon \text{ for } 1 \leq i \neq j \leq m. \end{aligned}$$

$$\begin{aligned} 9. &\text{Using (1), verify that } (K^T K)_{j,j} \geq \text{disc}(A) > \\ &0 \text{ for } 1 \leq j \leq m. \end{aligned}$$

10. Yield the tuple $\langle K, C \rangle$.
