### 1 Introduction

#### Contents

What is this? What follows is an experiment where I construct programs according to certain rules. While I do not list what these rules are, the following are a sketch of the sort of rules I have in mind:

- 1. The instruction "verify that a = a" is legal if it occurs after "choose an integer a"
- 2. The instruction "verify that b=a" is legal if it occurs after "verify that a=b"
- 3. The instruction "verify that a=c" is legal if it occurs after "verify that a=b" and "verify that b=c"
- 4. The instruction "verify that (a + b) + c = a + (b+c)" is legal if it occurs after "choose integers a, b, c"

Why was this made? I wanted to see whether programs constructed according to certain rules can serve a similar function to mathematical proofs. For example, let A be the  $100 \times 100$  matrix containing the multiplication table up to 100. At least to me, seeing the form of procedure 22 allows me to be confident enough to bet that  $\det(A^2) = \det(A)^2$  without carrying out the necessary computations.

How do I understand this? The task of understanding the following procedures should be the same as that of understanding any codebase. Hence running a debugger, that is, executing the following procedures step by step on some chosen input(s) and observing their control flows and sequences of program states should be equally helpful in making sense of them.

erations whereby, in each step a  $\mathbb{Q}[x]$  times either of Let us use the notation "diagonal" as a shorthand for the columns is added to the other.

#### 2.1.2 Implementation

- 1. Let A be our working matrix.
- 2. While  $A_{1,2} \neq 0$ , do the following:
  - (a) If  $deg(A_{1,1}) \leq deg(A_{1,2})$ , then:
    - i. Subtract  $\frac{x^{\deg(A_{1,2})} \circ A_{1,2}}{x^{\deg(A_{1,1})} \circ A_{1,1}} x^{\deg(A_{1,2}) \deg(A_{1,1})}$
    - ii. Now verify that either  $A_{1,2}$ 's degree has decreased or  $A_{1,2} = 0$ .
  - (b) Otherwise, do the following:
    - i. Let  $p \\ \frac{x^{\deg(A_{1,1})} \circ A_{1,1}}{x^{\deg(A_{1,2})} \circ A_{1,2}} x^{\deg(A_{1,1}) \deg(A_{1,2})}.$
    - ii. If  $A_{1,1} = pA_{1,2}$ , then do the following:
      - A. Add 1 p times  $A_{1,2}$  to  $A_{1,1}$ .
      - B. Verify that now  $A_{1,1} = A_{1,2}$ .
    - iii. Otherwise, do the following:
      - A. Verify that  $A_{1,1} \neq pA_{1,2}$ .
      - B. Add -p times  $A_{1,2}$  to  $A_{1,1}$ .
    - iv. Therefore verify that  $A_{1,1} \neq 0$ .
    - v. Also verify that  $A_{1,1}$ 's degree has de-
- 3. Verify that  $A_{1,2} = 0$ .
- 4. Verify that the changes to  $A_{1,1}$ , if any, have decreased its degree.
- 5. If sensical, do the following:
  - (a) Verify that all changes to  $A_{1,2}$  but the last have decreased its degree.
  - (b) Verify that  $deg(A_{1,1}) \leq the degree of the$ penultimate value of  $A_{1,2}$ .
- 6. Therefore verify that  $deg(A_{1,1}) \leq k$ .
- 7. If  $A_{*,1}$  was changed, then do the following:
  - (a) Verify that  $A_{1,1}$  was also changed.
  - (b) Therefore verify that  $deg(A_{1,1}) < q$ .
- 8. Yield the tuple  $\langle A \rangle$ .

"matrix positions such that the row index equals the column index".

Let us use the notation  $\mathcal{D}_{m,n}(A)$  as a shorthand for " $\mathcal{M}_{m,n}(A)$  with 0s in all the off-diagonal positions".

#### Procedure 2 2.2

#### 2.2.1Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to transform A into a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$  by a sequence of operations whereby either a  $\mathbb{Q}[x]$  times any of the columns is added to a different column, or a  $\mathbb{Q}[x]$  times any of the rows is added to a different row.

#### 2.2.2Implementation

- 1. If m=0 or n=0, then do the following:
  - (a) Verify that A is a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ .
  - (b) Yield the tuple  $\langle A \rangle$ .
- 2. Otherwise do the following:
- 3. Verify that m > 0 and n > 0.
- 4. Let A be our working matrix.
- 5. Now do the following:
  - (a) While there are non-zero entries in the top row less its first entry, do the following:
    - i. In the first row, select the  $\mathcal{M}_{m,2}(\mathbb{Q}[x])$ whose top-right entry coincides with the last non-zero entry of the first row
    - ii. Apply procedure 1 on this submatrix.
    - iii. Verify that the top-left and top-right entries of the submatrix are now nonzero and zero respectively.
    - iv. If the first column of A was modified by (5aii), then do the following:
      - A. Verify that  $deg(A_{1,1})$  decreased.
      - B. Go back to (5).
  - (b) Now do the same operations as in (a), but this time with the operations themselves reflected across the matrix's diagonal.

- row and the first column are zero.
- 7. Apply procedure on the submatrix  $A_{[2:m+1],[2:n+1]}$ .
- 8. Verify that (7)'s execution leaves the first row and column unchanged.
- 9. Verify that A is now a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ .
- 10. Yield the tuple  $\langle A \rangle$ .

#### 2.3 Procedure 3 (Associativity verification)

#### 2.3.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A, a  $\mathcal{M}_{n,p}(\mathbb{Q}[x])$ , B, and a  $\mathcal{M}_{p,q}(\mathbb{Q}[x])$ , C. The objective of the following instructions is to show that (AB)C = A(BC).

#### 2.3.2 Implementation

- 1. Verify that  $(AB)_{i,l} = \sum_{k=1}^{n} (A_{i,k} * B_{k,l})$  for  $1 \le n$  $i \leq m$ , for  $1 \leq l \leq p$ .
- Verify that  $((AB)C)_{i,r} = \sum_{l=1}^{p} ((AB)_{i,l} * C_{l,r}) = \sum_{l=1}^{p} (\sum_{k=1}^{n} (A_{i,k} * B_{k,l}) * C_{l,r})$  for  $1 \le i \le m$ , 2. Verify
- 3. Verify that  $(BC)_{k,r} = \sum_{l=1}^{p} (B_{k,l} * C_{l,r})$  for  $1 \le 1$ k < n, for 1 < r < q.
- Verify that  $(A(BC))_{i,r} = \sum_{k=1}^{n} (A_{i,k} * (BC)_{k,r}) = \sum_{k=1}^{n} (A_{i,k} * \sum_{l=1}^{p} (B_{k,l} * C_{l,r}))$  for  $1 \le i \le m$ , for  $1 \le r \le q$ . 4. Verify
- 5. Therefore Verify  $\sum_{l=1}^{p} \left( \sum_{k=1}^{n} \left( A_{i,k} * B_{k,l} * C_{l,r} \right) \right) \\ \sum_{k=1}^{n} \left( \sum_{l=1}^{p} \left( A_{i,k} * B_{k,l} * C_{l,r} \right) \right) \\ \sum_{k=1}^{n} \left( A_{i,k} * \sum_{l=1}^{p} \left( B_{k,l} * C_{l,r} \right) \right)$ =for  $1 \le i \le m$ , for  $1 \le r \le q$ .
- 6. Therefore verify that (AB)C = A(BC).

Let us use the notation  $I_n$  as a shorthand for "the  $\mathcal{M}_{n,n}(\mathbb{Q})$  with only 1s on the diagonal and 0s everywhere else".

Let us use the notation  $\mathcal{T}_m(\mathbb{Q}[x])$  as a shorthand for " $\mathcal{M}_{m,m}(\mathbb{Q}[x])$  with only 1s on the diagonal, a single  $\mathbb{Q}[x]$  off the diagonal, and 0s everywhere else".

6. Verify that, except for the top-left entry, the first Let us use the notation |A| as a shorthand for "the number of items in the list A".

#### Procedure 4 (Row and column op-2.4eration recording)

#### 2.4.1 Objective

Choose a procedure, A, and two non-negative integers m, n. The objective of the following instructions is to construct a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ s, M, and a list of  $\mathcal{T}_n(\mathbb{Q}[x])$ s, N such that  $M_{|M|+1-i}$  equals  $I_m$  after applying the  $i^{th}$  row operation carried out by A also on it, and  $N_i$  equals  $I_n$  after applying the  $i^{th}$  row operation carried out by A also on it.

#### 2.4.2 Implementation

- 1. Make an empty list, N.
- 2. Augment procedure A so that each time a polynomial x times a column i is added onto column j, an  $n \times n$  matrix that only has 1s on its diagonal, and such that the only non-zero entry off its diagonal is x at position (i, j), is appended onto
- 3. Make an empty list, M.
- 4. Also augment procedure A so that each time a polynomial x times a row i is added onto row i, an  $n \times n$  matrix that only has 1s on its diagonal, and such that the only non-zero entry off its diagonal is x at position (j,i), is prepended onto
- 5. Now run procedure A.
- 6. Yield the tuple  $\langle M, N \rangle$ .

#### 2.5 Procedure 5 (Multiplication by identity)

#### 2.5.1Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to show that  $I_m A = A = AI_n$ .

#### 2.5.2 Implementation

- 1. For  $1 \le r \le m$ , do the following:
  - (a) For  $1 \le t \le n$ , do the following:

i. Verify that 
$$(I_m A)_{r,t} = \sum_{u=1}^m (I_m)_{r,u} A_{u,t} = (I_m)_{r,r} A_{r,t} = 1 * A_{r,t} = A_{r,t}.$$

- 2. Therefore verify that  $I_m A = A$ .
- 3. For  $1 \le r \le m$ , do the following:
  - (a) For  $1 \le t \le n$ , do the following:

i. Verify that 
$$(AI_n)_{r,t} = \sum_{u=1}^m A_{r,u}(I_n)_{u,t} = A_{r,t}(I_n)_{t,t} = A_{r,t} * 1 = A_{r,t}.$$

4. Therefore verify that  $AI_n = A$ .

Let us use the notation  $M_*$  as a shorthand for " $\prod_{i=1}^{|M|} M_i$ ".

## 2.6 Procedure 6 (Matrix list inversion)

#### 2.6.1 Objective

Choose a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ , A. The objective of the following instructions is to define a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ ,  $A^{-1}$ , such that  $A_*A^{-1}_* = I_m$ .

#### 2.6.2 Implementation

- 1. Let  $A^{-1}$  be  $\langle \rangle$ .
- 2. For i = 1 to i = |A|, do the following:
  - (a) Let (j, k) be the position of the off diagonal entry of  $A_i$ .
  - (b) Let B equal  $A_i$  but with entry (j,k) negated.
  - (c) For  $1 \le r \le m$  and  $r \ne j$ , do the following:
    - i. For  $1 \le t \le m$ , do the following:

A. Verify that 
$$(A_iB)_{r,t} = \sum_{u=1}^{m} (A_i)_{r,u} B_{u,t} = (A_i)_{r,r} B_{r,t} = 1 * B_{r,t} = [r=t].$$

(d) For  $1 \le t \le m$  and  $t \ne k$ , do the following:

i. Verify that 
$$(A_iB)_{j,t} = \sum_{u=1}^{m} (A_i)_{j,u} B_{u,t} = (A_i)_{j,t} B_{t,t} = (A_i)_{j,t} * 1 = [j = t].$$

- (e) Verify that  $(A_iB)_{j,k} = \sum_{u=1}^m (A_i)_{j,u} B_{u,k} = (A_i)_{j,j} B_{j,k} + (A_i)_{j,k} B_{k,k} = 1 * B_{j,k} + (A_i)_{j,k} * 1 = B_{j,k} + (A_i)_{j,k} = 0.$
- (f) Therefore verify that  $A_iB = I_m$ .
- (g) Now prepend B onto  $A^{-1}$ .
- 3. Verify that  $|A| = |A^{-1}|$ .

## 2.7 Procedure 7

#### 2.7.1 Objective

Choose a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ , A. The objective of the following instructions is to show that  $(A^{-1})^{-1} = A$  and  $A^{-1}_*A_* = I_m$ .

#### 2.7.2 Implementation

- 1. Verify that  $(A^{-1})^{-1} = A$ .
- 2. Therefore using procedure 6, verify that  $A^{-1}{}_*A_* = A^{-1}{}_*(A^{-1})^{-1}{}_* = I_m$ .

#### 2.8 Procedure 8

#### 2.8.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to define the polynomials  $u_1, u_2, \cdots, u_{\min(m,n)}$  and transform A into a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$  such that  $A_{k,k} = u_k A_{1,1}$  for  $1 \leq k \leq \min(m,n)$  by a sequence of operations whereby either a  $\mathbb{Q}[x]$  times any of the columns is added to a different column, or a  $\mathbb{Q}[x]$  times any of the rows is added to a different row.

#### 2.8.2 Implementation

- 1. Let  $u = \langle 1 \rangle$ .
- 2. For j going from 2 to min(m, n), do the following:
  - (a) Verify that  $A_{k,k} = u_k A_{1,1}$  for k = 1 to k = |u|.
  - (b) Add row j to row 1.
  - (c) Now verify that  $A_{1,i} = A_{i,i}$ .
  - (d) Set A' = A and let A' be our working matrix.
  - (e) Let  $\langle M, N \rangle$  receive the results of executing procedure 4 on the pair  $\langle m, n \rangle$  and the following procedure:
    - i. Execute procedure 1 on the submatrix of A' formed by selecting row 1 and columns 1 and j as if there were nothing in between.
  - (f) Now verify that:
    - i. M is empty.
    - ii.  $AN_* = M_*AN_* = A'$ .
    - iii.  $A = AI_n = AN_*N^{-1}_* = A'N^{-1}_*$ .
    - iv.  $A'_{1,i} = 0$ .
    - v.  $A_{1,1} = A'_{1,1}N^{-1}_{*1,1} + A'_{1,j}N^{-1}_{*j,1} = A'_{1,1}N^{-1}_{*1,1}$ .
    - vi.  $A_{j,j} = A_{1,j} = A'_{1,1} N^{-1}_{*1,j} + A'_{1,j} N^{-1}_{*j,j} = A'_{1,1} N^{-1}_{*1,j}.$
    - vii.  $A_{i,1} = 0$ .
    - viii.  $A'_{j,1} = A_{j,1}N_{*1,1} + A_{j,j}N_{*j,1} = A_{j,j}N_{*j,1} = A'_{1,1}N^{-1}_{*1,j}N_{*j,1}.$
    - ix.  $A'_{j,j} = A_{j,1}N_{*1,j} + A_{j,j}N_{*j,j} = A_{j,j}N_{*j,j} = A'_{1,1}N^{-1}_{*1,j}N_{*j,j}.$
  - (g) Subtract  $N^{-1}_{*1,j}N_{*j,1}$  times row 1 from row j.
  - (h) Now verify that  $A'_{i,1} = 0$ .
  - (i) For k = 2 to k = |u|, do the following:
    - i. Verify that  $A'_{k,k} = A_{k,k} = u_k A_{1,1} = u_k A'_{1,1} N^{-1}_{*1,1}$ .
    - ii. Set  $u_k = u_k N^{-1}_{*1,1}$ .
    - iii. Hence verify that  $A'_{k,k} = u_k A'_{1,1}$ .

- (j) Let  $u_j = N^{-1}_{*1,j} N_{*j,j}$ .
- (k) Hence verify that  $A'_{i,j} = u_j A'_{1,1}$ .
- (1) Now let A = A'.
- 3. Hence verify that  $A'_{k,k} = u_k A'_{1,1}$  for k = 1 to  $k = \min(m, n)$ .
- 4. Yield  $\langle u \rangle$ .

Let us use the notation [a:b] as a shorthand for "the list  $\langle a, a+1, \cdots b-1 \rangle$ ".

## 2.9 Procedure 9 (Block matrix multiplication)

#### 2.9.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A, and a  $\mathcal{M}_{n,k}(\mathbb{Q}[x])$ , B. Choose integers  $1 \leq a \leq m$ ,  $1 \leq b \leq n$ , and  $1 \leq c \leq k$ . The objective of the following instructions is to show that  $(AB)_{[1:a],[1:c]} = A_{[1:a],[1:b]}B_{[1:b],[1:c]} + A_{[1:a],[b:n+1]}B_{[b:n+1],[1:c]}$ .

#### 2.9.2 Implementation

- 1. Multiply matrix A by matrix B.
- 2. For each  $1 \le i \le a 1$ , do the following:
  - (a) For each  $1 \le j \le c 1$ , do the following:
    - i. Verify that  $(AB)_{i,j} = \sum_{p=1}^{n} A_{i,p} B_{p,j} = \sum_{p=1}^{b-1} A_{i,p} B_{p,j} + \sum_{p=b}^{n} A_{i,p} B_{p,j} = \sum_{p=1}^{b-1} (A_{[1:a],[1:b]})_{i,p} (B_{[1:b],[1:c]})_{p,j} + \sum_{p=1}^{1+n-b} (A_{[1:a],[b:n+1]})_{i,p} (B_{[b:n+1],[1:c]})_{p,j} = (A_{[1:a],[1:b]} B_{[1:b],[1:c]})_{i,j} + (A_{[1:a],[b:n+1]} B_{[b:n+1],[1:c]})_{i,j}.$
- 3. Therefore verify that  $(AB)_{[1:a],[1:c]} = A_{[1:a],[1:b]}B_{[1:b],[1:c]} + A_{[1:a],[b:n+1]}B_{[b:n+1],[1:c]}$ .
- 4. Do similar computations to verify that the other three blocks of AB are computed in an analogous way to multiplying two  $2 \times 2$  matrices.

## 2.10 Procedure 10 (Smith normal form construction)

#### 2.10.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. Let  $A_{0,0} = 1$ . The objective of the following instructions is to define the polynomials  $v_1, v_2, \dots, v_{\min(m,n)}$  and transform A into a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$  such that  $A_{k,k} = v_k A_{k-1,k-1}$  for  $1 \leq k \leq \min(m,n)$  by a sequence of operations whereby either a  $\mathbb{Q}[x]$  times any of the columns is added to a different column, or a  $\mathbb{Q}[x]$  times any of the rows is added to a different row.

#### 2.10.2 Implementation

- 1. Apply procedure 2 on matrix A.
- 2. Let  $v = \langle \rangle$ .
- 3. Let  $p = \langle A_{1,1}, A_{2,2}, \cdots, A_{\min(m,n), \min(m,n)} \rangle$ .
- 4. For j going from 1 to min(m, n), do the following:
  - (a) Set A' = A.
  - (b) Let  $\langle M, N \rangle$  receive the results of executing procedure 4 on the pair  $\langle m, n \rangle$  and the following procedure:
    - i. Apply procedure 8 on the submatrix of A' containing rows j to m and columns j to n, and let  $\langle u \rangle$  receive.
  - (c) Verify that  $A'_{k,k} = u_{k+1-j}A'_{j,j}$  for k = j to  $k = \min(m, n)$ .
  - (d) Verify that A' is the same as A modulo the submatrix spanning rows j to m and columns j to n.
  - (e) Verify that  $M_i$  is the same as  $I_m$  modulo the submatrix spanning rows j to m and columns j to m, for i = 1 to |M|.
  - (f) Therefore verify that  $M_*$  is the same as  $I_m$  modulo the submatrix spanning rows j to m and columns j to m.
  - (g) Verify that  $N_i$  is the same as  $I_n$  modulo the submatrix spanning rows j to n and columns j to n, for i = 1 to |N|.
  - (h) Therefore verify that  $N_*$  is the same as  $I_n$  modulo the submatrix spanning rows j to n and columns j to n.

- (i) Verify that  $A' = M_*AN_*$ .
- (j) Let  $v_j = \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j}(N_*)_{r,j}$ .
- (k) Hence using (f), (h), and (i), verify that  $A'_{j,j} = (M_*AN_*)_{j,j} = \sum_{r=1}^{m} (M_*)_{j,r} (AN_*)_{r,j} = \sum_{r=1}^{\min(m,n)} (M_*)_{j,r} (AN_*)_{r,j} = \sum_{r=1}^{\min(m,n)} (M_*)_{j,r} A_{r,r} (N_*)_{r,j} = \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} A_{r,r} (N_*)_{r,j} = \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} A_{j-1,j-1} p_{r+1-j} (N_*)_{r,j} = A_{j-1,j-1} \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j} (N_*)_{r,j} = A'_{j-1,j-1} \sum_{r=j}^{\min(m,n)} (M_*)_{j,r} p_{r+1-j} (N_*)_{r,j} = A'_{j-1,j-1} V_{j}.$
- (1) Set A to A'.
- (m) Set p to  $u_{2:|u|}$ .
- 5. Yield the tuple  $\langle v \rangle$ .

## 2.11 Procedure 11 (Determinant calculation)

#### 2.11.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to define the  $\mathbb{Q}[x]$  det(A).

#### 2.11.2 Implementation

- 1. If m=0, then do the following:
  - (a) Yield the tuple  $\langle 1 \rangle$ .
- 2. Otherwise, do the following:
  - (a) Yield the tuple  $\langle \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \det(A_{[1:r][r+1,m+1],[2:m+1]}) \rangle$ .

## 2.12 Procedure 12 (Multilinearity verification)

#### 2.12.1 Objective

Choose a  $\mathbb{Q}[x]$  p. Choose two  $\mathcal{M}_{m,1}(\mathbb{Q}[x])$ s, B and C. Choose an integer  $0 < i \leq m$ . Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A, such that its  $i^{th}$  column is B + pC. Let A' be A but with the  $i^{th}$  column replaced by B and let A''' be A but with the  $i^{th}$  column replaced by C. The

objective of the following instructions is to show that det(A) = det(A') + p det(A''').

#### 2.12.2 Implementation

1. If i = 1, then verify that det(A)

(a) = 
$$\sum_{r=1}^{m} (-1)^{r-1} A_{r,1}$$
$$\det(A_{[1:r][r+1:m+1],[2:m+1]})$$

(b) = 
$$\sum_{r=1}^{m} (-1)^{r-1} (B + pC)_{r,1}$$
  
 $\det(A_{[1:r][r+1:m+1],[2:m+1]})$ 

$$(c) = \sum_{r=1}^{m} (-1)^{r-1} (B)_{r,1}$$

$$(c) = \sum_{r=1}^{m} (-1)^{r-1} (B)_{r,1}$$

$$\sum_{r=1}^{m} (-1)^{r-1} (pC)_{r,1}$$

$$\det(A_{[1:r][r+1:m+1],[2:m+1]})$$

(d) = 
$$\sum_{r=1}^{m} (-1)^{r-1} (B)_{r,1}$$
$$\det(A_{[1:r][r+1:m+1],[2:m+1]})$$
$$p \sum_{r=1}^{m} (-1)^{r-1} (C)_{r,1}$$
$$\det(A_{[1:r][r+1:m+1],[2:m+1]})$$

(e) = 
$$\sum_{r=1}^{m} (-1)^{r-1} (A')_{r,1}$$
$$\det(A'_{[1:r][r+1:m+1],[2:m+1]})$$
$$p \sum_{r=1}^{m} (-1)^{r-1} (A''')_{r,1}$$
$$\det(A'''_{[1:r][r+1:m+1],[2:m+1]})$$

- $(f) = \det(A') + p \det(A''')$
- 2. Otherwise, do the following:
  - (a) For r = 1 to r = m, do the following:
    - i. Execute **procedure** 12 on  $\langle p, B_{[1:r][r+1:m+1],1}, C_{[1:r][r+1:m+1],1}, i-1, A_{[1:r][r+1:m+1],[2:m+1]} \rangle$ .
  - (b) Therefore using (a), verify that det(A)

i. = 
$$\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \det(A_{[1:r][r+1:m+1],[2:m+1]})$$

ii. = 
$$\sum_{r=1}^{m} (-1)^{r-1} A_{r,1}$$
 (det( $A'_{[1:r][r+1:m+1],[2:m+1]}$ )  $p \det(A'''_{[1:r][r+1:m+1],[2:m+1]}$ ))

iii. = 
$$\sum_{r=1}^{m} (-1)^{r-1} A'_{r,1}$$
$$\det(A'_{[1:r][r+1:m+1],[2:m+1]})$$
$$\sum_{r=1}^{m} (-1)^{r-1} A''_{r,1}$$
$$p \det(A'''_{[1:r][r+1:m+1],[2:m+1]})$$

iv. = 
$$det(A') + p det(A''')$$
.

Make an analogous procedure for cases when a given row is the sum of two  $1 \times m$  matrices.

## 2.13 Procedure 13 (Alternation verification)

#### 2.13.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A. Choose a row  $1 < i \le m$ . Let A' be A with columns i-1 and i swapped. The + objective of the following instructions is to show that  $\det(A') = -\det(A)$ .

### 2.13.2 Implementation

- 1. If i = 2, then verify that det(A)
  - (a) =  $\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \det(A_{[1:r][r+1:m+1],[2:m+1]})$
  - (b) =  $\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \sum_{t=r+1}^{m} (-1)^{t-2} A_{t,2}$   $\det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$  +  $\sum_{t=1}^{m} (-1)^{t-1} A_{t,1} \sum_{r=1}^{t-1} (-1)^{r-1} A_{r,2}$   $\det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$
  - $\begin{array}{ll} \text{(c)} &= \sum_{t=1}^m (-1)^{t-2} A_{t,2} \sum_{r=1}^{t-1} (-1)^{r-1} A_{r,1} \\ & \det \left( A_{[1:r][r+1:t][t+1:m+1],[3:m+1]} \right) \\ & + \sum_{r=1}^m (-1)^{r-1} A_{r,2} \sum_{t=r+1}^m (-1)^{t-1} A_{t,1} \\ & \det \left( A_{[1:r][r+1:t][t+1:m+1],[3:m+1]} \right) \end{array}$
  - (d) =  $\sum_{t=1}^{m} (-1)^{t-2} A'_{t,1} \sum_{r=1}^{t-1} (-1)^{r-1} A'_{r,2}$  +  $\det(A'_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$  +  $\sum_{r=1}^{m} (-1)^{r-1} A'_{r,1} \sum_{t=r+1}^{m} (-1)^{t-1} A'_{t,2}$  +  $\det(A'_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$
  - (e) =  $-(\sum_{r=1}^{m} (-1)^{r-1} A'_{r,1} \sum_{t=r+1}^{m} (-1)^{t-2} A'_{t,2} \cdot \det(A'_{[1:r][r+1:t][t+1:m+1],[3:m+1]}) + \sum_{t=1}^{m} (-1)^{t-1} A'_{t,1} \sum_{r=1}^{t-1} (-1)^{r-1} A'_{r,2} \cdot \det(A'_{[1:r][r+1:t][t+1:m+1],[3:m+1]}))$
  - (f) =  $-\det(A')$ .
- 2. Otherwise do the following:
  - (a) Verify that i > 2.
  - (b) For r = 1 to r = m, do the following:
    - i. Execute procedure 13 on  $(i 1, A_{[1:r][r+1:m+1],[2:m+1]})$ .

ii. Therefore verify that 
$$\det(A_{[1:r][r+1:m+1],[2:m+1]}) = -\det(A'_{[1:r][r+1:m+1],[2:m+1]}).$$

(c) Therefore using (b), verify that 
$$\det(A) = \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \cdot \det(A_{[1:r][r+1:m+1],[2:m+1]}) = \sum_{r=1}^{m} (-1)^{r-1} A'_{r,1} \cdot (-\det(A'_{[1:r][r+1:m+1],[2:m+1]})) = -\det(A').$$

Make an analogous procedure to verify that row swaps cause sign alternations.

#### 2.14 Procedure 14

#### 2.14.1 Objective

Choose integers  $1 < i \le m$ . Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A, such that columns i-1 and i are the same. The objective of the following instructions is to show that  $\det(A) = 0$ .

#### 2.14.2 Implementation

- 1. If i = 2, then verify that det(A)
  - (a) =  $\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \det(A_{[1:r][r+1:m+1],[2:m+1]})$
  - (b)  $= \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \sum_{t=r+1}^{m} (-1)^{t-2} A_{t,2} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]}) + \sum_{t=1}^{m} (-1)^{t-1} A_{t,1} \sum_{r=1}^{t-1} (-1)^{r-1} A_{r,2} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$
  - (c) =  $\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \sum_{t=r+1}^{m} (-1)^{t-2} A_{t,2} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]}) + \sum_{r=1}^{m} (-1)^{r-1} A_{r,2} \sum_{t=r+1}^{m} (-1)^{t-1} A_{t,1} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$
  - (d) =  $-\sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \sum_{t=r+1}^{m} (-1)^{t-1} A_{t,2} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]}) + \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \sum_{t=r+1}^{m} (-1)^{t-1} A_{t,2} \cdot \det(A_{[1:r][r+1:t][t+1:m+1],[3:m+1]})$
  - (e) = 0.
- 2. Otherwise do the following:
  - (a) Verify that i > 2.
  - (b) For r = 1 to r = m, do the following:
    - i. Execute procedure 14 on  $\langle i-1, A_{[1:r][r+1:m+1],[2:m+1]} \rangle$ .
    - ii. Therefore verify that  $\det(A_{[1:r][r+1:m+1],[2:m+1]}) = 0.$

(c) Therefore using (b), verify that 
$$\det(A) = \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} \det(A_{[1:r][r+1:m+1],[2:m+1]}) = \sum_{r=1}^{m} (-1)^{r-1} A_{r,1} * 0 = 0.$$

that Make an analogous procedure to verify that

matrix choices with repeated rows yield de
terminants equal to zero.

#### 2.15 Procedure 15

#### 2.15.1 Objective

Choose integers  $1 \leq i \leq m$ . Choose an integer  $0 < j \leq m-i$ . Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A. Let A' be A but with column i moved j places. The objective of the following instructions is to show that  $\det(A') = (-1)^j \det(A)$ .

#### 2.15.2 Implementation

- 1. Let  $A_i = A$ .
- 2. For k = i + 1 to k = i + j, do the following:
  - (a) Let  $A_k$  be obtained by swapping columns k-1 and k of  $A_{k-1}$ .
  - (b) Using procedure 13, verify that  $det(A_k) = -det(A_{k-1})$ .
- 3. Verify that  $A' = A_{i+j}$ .
- 4. Therefore verify that  $\det(A') = \det(A_{i+j}) = (-1)^1 \det(A_{i+j-1}) = \cdots = (-1)^j \det(A_i) = (-1)^j \det(A)$ .

Make an analogous procedure that verifies that  $\det(A') = (-1)^j \det(A)$  when a non-positive integer, j, is chosen.

Also make an analogous procedure that does the verification for moved rows.

## 2.16 Procedure 16 (Compound matrix calculation)

#### 2.16.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A, and choose an integer  $0 \leq k \leq \min(m,n)$ . The objective of the following instructions is to define the  $\mathcal{M}_{\binom{m}{k},\binom{n}{k}}(\mathbb{Q}[x])$   $C_k(A)$ .

#### 2.16.2 Implementation

- 1. Yield a tuple comprising the  $\binom{m}{k} \times \binom{n}{k}$  matrix constructed as follows:
  - (a) The rows are labeled by the colexicographically sorted list of increasing length-k sequences whose elements are picked from the first m positive integers.
  - (b) The columns are labeled by the colexicographically sorted list of increasing lengthk sequences whose elements are picked from the first n positive integers.
  - (c) For each row label I: For each column label J: Let the entry at position (I, J) be  $\det(A_{I,I})$ .

We will use the notation  $C_k(A)$  to refer to an invocation of procedure 16 on the matrix A.

We will use the notation  $A_{\underline{I},\underline{J}}$  to refer to the entry of A with row label I and column label J.

## 2.17 Procedure 17 (Compound matrix of identity calculation)

#### 2.17.1 Objective

Choose two integers  $0 \le k \le m$ . The objective of the following instructions is to show that  $C_k(I_m) = I_{\binom{m}{k}}$ .

#### 2.17.2 Implementation

- 1. For each row label I of  $C_k(I_m)$ , for each column label J of  $C_k(I_m)$ , do the following:
  - (a) If the I = J, then do the following:
    - i. Verify that  $((I_m)_{I,J})_{i,j} = ((I_m)_{J,J})_{i,j} = (I_m)_{J_i,J_j} = [J_i = J_j] = [i = j]$  for  $1 \le i \le k$ , for  $1 \le j \le k$ .
    - ii. Therefore verify that  $(C_k(I_m))_{\underline{I},\underline{J}} = I_k$ .
    - iii. Therefore using procedure 11, verify that  $(C_k(I_m))_{\underline{I},\underline{J}} = \det((I_m)_{I,J}) = \det(I_k) = 1$ .
  - (b) Otherwise, do the following:
    - i. Verify that  $I \neq J$ .

- ii. Let i be the index of an element of I that is not an element of J.
- iii. Now verify that  $(I_m)_{I_i,j} = [I_i = j] = 0$ , for each j in J.
- iv. Therefore verify that  $((I_m)_{I,J})_{i,*} = 0_{1\times k}$ .
- v. Therefore using procedure 11, verify that  $(C_k(I_m))_{\underline{I},\underline{J}} = \det((I_m)_{I,J}) = 0$ .
- 2. Therefore verify that  $C_k(I_m) = I_{\binom{m}{k}}$ .

### 2.18 Procedure 18

### 2.18.1 Objective

Choose an integer  $1 \leq k \leq \min(m, n)$ . Choose a  $\mathcal{T}_m(\mathbb{Q}[x])$ , A, such that the off diagonal entry is the  $\mathbb{Q}[x]$  p at (i, j). Also choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , B. The objective of the following instructions is to construct a  $\mathcal{M}_{\binom{m}{k},\binom{m}{k}}(\mathbb{Q}[x])$  D such that  $C_k(AB) = DC_k(B)$ .

#### 2.18.2 Implementation

- 1. Let  $D = C_k(I_m) = I_{\binom{m}{k}}$ .
- 2. Verify that AB equals B, but with its row i having p times B's row j added to it.
- 3. Go through the row labels, I, of  $C_k(AB)$  and do the following:
  - (a) If  $i \notin I$ , then do the following:
    - i. Verify that  $(AB)_{I,[1:n+1]} = B_{I,[1:n+1]}$ .
    - ii. Therefore for each column label J, verify that  $C_k(AB)_{\underline{I},\underline{J}} = \det((AB)_{I,J}) = \det(B_{I,J}) = C_k(B)_{I,J}$ .
    - iii. Therefore verify that  $(C_k(AB))_{I,*} = (C_k(B))_{I,*}$ .
  - (b) Otherwise, if  $i \in I$ , then:
    - i. Let I' be I but with an in-place replacement of i by j.
    - ii. For each column label J: Using procedure 12, verify that  $C_k(AB)_{\underline{I},\underline{J}} = \det((AB)_{I,J}) = \det(B_{I,J}) + p * \det(B_{I',J})$ .

- iii. If  $j \in I$ , then do the following:
  - A. Verify that the sequence I' contains two js.
  - B. For each column label J: Using procedure 14 verify that  $\det(B_{I',J}) = 0$ .
  - C. Therefore for each column label J: verify that  $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) = C_k(B)_{I,J}$ .
  - D. Therefore verify that  $C_k(AB)_{\underline{I},*} = C_k(B)_{\underline{I},*}$ .
- iv. Otherwise if  $j \notin I$ , do the following:
  - A. Let l be the signed number of places that the j introduced above needs to be moved in order to make I' an increasing sequence.
  - B. Let I'' be obtained from I' by moving the integer j in I' by l places.
  - C. For each column label J: Using procedure 15, verify that  $\det(B_{I'',J}) = (-1)^l \det(B_{I'',J})$ .
  - D. Therefore for each column label J: Verify that  $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) + p * \det(B_{I',J}) = \det(B_{I,J}) + (-1)^l p * \det(B_{I'',J}).$
  - E. Verify that I'' is a row label of  $C_k(B)$ .
  - F. Therefore for each column label J: Verify that  $C_k(AB)_{\underline{I},\underline{J}} = \det(B_{I,J}) + (-1)^l p * \det(B_{I'',J}) = C_k(B)_{I,J} + (-1)^l p * C_k(B)_{I'',J}.$
  - G. Therefore verify that  $(C_k(AB))_{\underline{I},*} = (C_k(B))_{\underline{I},*} + (-1)^l p(C_k(B))_{\underline{I}',*}$ .
  - H. Set  $D_{I,I''}$  to  $(-1)^{l}p$ .
- (c) Therefore verify that  $C_k(AB)_{\underline{I},*} = D_{\underline{I},*}C_k(B)$ .
- 4. Therefore verify that  $C_k(AB) = DC_k(B)$ .

#### 2.19 Procedure 19

### 2.19.1 Objective

Choose a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ , A. Also choose an  $\mathcal{M}_{n,n}(\mathbb{Q}[x])$ , B. Also choose an integer  $0 \le k \le \min(m,n)$ . The objective of the following instructions is to construct a  $\mathcal{D}_{\binom{m}{k},\binom{n}{k}}(\mathbb{Q}[x])$  D such that  $C_k(AB) = DC_k(B)$ .

#### 2.19.2 Implementation

- 1. Let  $D = C_k(0_{m \times n}) = 0_{\binom{m}{k} \times \binom{n}{k}}$ .
- 2. Verify that AB equals  $B_{[1:\min(m,n)+1],[1:n+1]}$  with each row i multiplied by  $A_{i,i}$ .
- 3. Go through the row labels, I, of  $C_k(AB)$  and do the following:
  - (a) If  $I_k \leq \min(m, n)$ , then do the following:
    - i. Using procedure 16, verify that every element of I is less than or equal to  $\min(m, n)$ .
    - ii. Let  $A_0 = A$ .
    - iii. For i = 1 to i = k: Let  $A_i$  equal  $A_{i-1}$  but with position  $(I_i, I_i)$  set to 1.

    - v. Therefore verify that  $(C_k(AB))_{\underline{I},*} = A_{I_1,I_1}A_{I_1,I_1}\cdots A_{I_k,I_k} * (C_k(B))_{I,*}.$
    - vi. Set  $D_{I,I}$  to  $A_{I_1,I_1}A_{I_1,I_1}\cdots A_{I_k,I_k}$ .
  - (b) Otherwise if  $I_k > \min(m, n)$ , then do the following:
    - i. Verify that  $A_{I_k,*} = 0_{1 \times n}$ .
    - ii. Therefore verify that  $(AB)_{I_k,*} = 0_{1\times n}$ .
    - iii. Therefore verify that  $((AB)_{I,*})_{k,*} = 0_{1\times n}$ .

- iv. Therefore using procedure 11, for each column label J: verify that  $C_k(AB)_{I,J} = \det((AB)_{I,J}) = 0$ .
- v. Therefore verify that  $(C_k(AB))_{\underline{I},*}$  is zero.
- (c) Therefore verify that  $C_k(AB)_{\underline{I},*} = D_{I,*}C_k(B)$ .
- 4. Verify that D is diagonal.
- 5. Verify that  $C_k(AB) = DC_k(B)$ .

#### 2.20 Procedure 20

#### 2.20.1 Objective

Choose an integer  $1 \leq k \leq \min(m, n)$ . Choose a  $\mathcal{T}_m(\mathbb{Q}[x])$ , A, such that the off diagonal entry is the  $\mathbb{Q}[x]$  p at (i, j). Also choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , B. The objective of the following instructions is to show that  $C_k(AB) = C_k(A)C_k(B)$ .

#### 2.20.2 Implementation

- 1. Execute procedure 18 on matrices A and  $I_m$ . Let D be the matrix constructed.
- 2. Using procedure 17, verify that  $C_k(A) = C_k(AI_m) = DC_k(I_m) = DI_{\binom{m}{k}} = D$ .
- 3. Execute procedure 18 on matrices A and B. Let D' be the matrix constructed.
- 4. Verify that  $C_k(AB) = D'C_k(B)$ .
- 5. Verify that  $D' = D = C_k(A)$ .
- 6. Therefore verify that  $C_k(AB) = C_k(A)C_k(B)$ .

Make an analogous procedure to show that  $C_k(BA) = C_k(B)C_k(A)$ .

Using procedure 19, make a procedure similar to the above but that only instead allows for a diagonal matrix of  $\mathbb{Q}[x]s$ , A, to be chosen.

#### 2.21 Procedure 21

#### 2.21.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. Let  $D_{0,0}=1$ . The objective of the following instructions is to construct a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ s, M, a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ , D, a list of  $\mathbb{Q}[x]$ s, v, and a list of  $\mathcal{T}_n(\mathbb{Q}[x])$ s, N, such that MAN=D,  $A=M^{-1}DN^{-1}$ , and  $D_{i,i}=v_iD_{i-1,i-1}$  for i=1 to  $i=\min(m,n)$ .

#### 2.21.2 Implementation

- 1. Let D be a copy of A.
- 2. Let  $\langle M, N \rangle$  receive the results of executing procedure 4 on the pair  $\langle m, n \rangle$  and the following procedure:
  - (a) Execute procedure 10 on the matrix D and let \( \lambda v \rangle \) receive.
- 3. Verify that  $D_{i,i} = v_i D_{i-1,i-1}$  for i = 1 to  $i = \min(m, n)$ .
- 4. Verify that  $M_*AN_* = D$ .
- 5. Hence verify that  $A = I_m A I_n = M^{-1}_* M_* A N_* N^{-1}_* = M^{-1}_* D N^{-1}_*$ .
- 6. Yield the tuple  $\langle M, D, v, N \rangle$ .

# 2.22 Procedure 22 (Compound matrix of matrix product calculation)

#### 2.22.1 Objective

Choose integers  $0 \leq k \leq \min(m, n, p)$ . Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. Also choose a  $\mathcal{M}_{n,p}(\mathbb{Q}[x])$ , B. The objective of the following instructions is to show that  $C_k(AB) = C_k(A)C_k(B)$ .

#### 2.22.2 Implementation

- 1. Execute procedure 21 on A and let  $\langle M, D, N \rangle$  receive.
- 2. Using repeated applications of procedure 20, verify that  $C_k(AB)$

(a) = 
$$C_k(M^{-1}_1 \cdots M^{-1}_{|M|}DN^{-1}_1 \cdots N^{-1}_{|N|}B)$$

(b) = 
$$C_k(M^{-1}_1) \cdots C_k(M^{-1}_{|M|}) * C_k(D) * C_k(N^{-1}_1) \cdots C_k(N^{-1}_{|N|}) C_k(B)$$

 $({\bf c}) = C_k (M^{-1}{}_1 \cdots M^{-1}{}_{|M|} DN^{-1}{}_1 \cdots N^{-1}{}_{|N|}) C_k (B) \ \, {\bf Yield \ the \ tuple} \ \, \langle A^T \rangle.$ 

(d) =  $C_k(A)C_k(B)$ .

#### (Determinant 2.23 Procedure 23equals product of diagonal entries verification)

#### 2.23.1Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A. Let D be a copy of A. Execute procedure 2 on D. The objective of the following instructions is to show that det(A) is the product of the diagonal entries of D.

#### Implementation 2.23.2

- 1. Execute procedure 21 on A and let  $\langle M, D, N \rangle$ receive.
- 2. Using procedure 11 and procedure 22, verify that  $\det(A)$

(a) 
$$= C_m(A)$$

(b) = 
$$C_m(M^{-1}_1 \cdots M^{-1}_{|M|}DN^{-1}_1 \cdots N^{-1}_{|N|})$$

(c) = 
$$C_m(M^{-1}_1) \cdots C_m(M^{-1}_{|M|}) C_m(D) C_m(N^{-1}_1) \cdots C_m(N^{-1}_{|N|})$$
 2.26

(d) = 
$$1 \cdots 1C_m(D)1 \cdots 1 = C_m(D)$$

(e) = 
$$\det(D)$$
.

3. Using procedure 11, verify that det(D) is the product of the diagonal entries of D.

#### 2.24Procedure 24 (Transpose calculation)

#### 2.24.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to define the  $\mathcal{M}_{n,m}(\mathbb{Q}[x])$   $A^T$ .

#### 2.24.2Implementation

- 1. Make an  $n \times m$  matrix,  $A^T$ .
- 2. For i = 1 to i = n:

- (a) For j = 1 to j = m: i. Let  $A^{T}_{i,i} = A_{i,i}$ .

#### 2.25Procedure 25 (Transpose of product verification)

#### 2.25.1Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A, and a  $\mathcal{M}_{n,k}(\mathbb{Q}[x])$ , B. The objective of the following instructions is to show that  $B^T A^T = (AB)^T$ .

#### 2.25.2 Implementation

- 1. Verify that  $B^TA^T$  and  $(AB)^T$  have dimensions  $k \times m$ .
- 2. For i = 1 to i = k:
  - (a) For j = 1 to j = m:
    - i. Using procedure 24, verify that  $(B^TA^T)_{i,j} = \sum_{l=0}^n B_{l,i}A_{j,l} = \sum_{l=0}^n A_{j,l}B_{l,i} = (AB)_{j,i} = ((AB)^T)_{i,j}.$
- 3. Therefore verify that  $B^TA^T = (AB)^T$ .

#### 2.26Procedure 26 (Determinant of transpose verification)

#### 2.26.1Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , A. The objective of the following instructions is to show that  $det(A^T) = det(A)$ .

#### 2.26.2Implementation

- 1. Execute procedure 21 on A and let  $\langle M, D, N \rangle$ receive.
- 2. Therefore using procedures 19 and 20, verify that  $\det(A^T)$

(a) = 
$$\det((M^{-1}_1 \cdots M^{-1}_{|M|} DN^{-1}_1 \cdots N^{-1}_{|N|})^T)$$

(b) = 
$$\det((N^{-1}_{|N|})^T \cdots (N^{-1}_1)^T D^T (M^{-1}_{|M|})^T \cdots (M^{-1}_1)^T)$$

(c) = 
$$\det(D^T)$$

$$(d) = det(D)$$

- (e) =  $\det(M^{-1}_{1} \cdots M^{-1}_{|M|} DN^{-1}_{1} \cdots N^{-1}_{|N|})$
- $(f) = \det(A).$

## 2.27 Procedure 27 (Compound matrix of transpose verification)

#### 2.27.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A, and an integer  $0 \leq k \leq \min(m,n)$ . The objective of the following instructions is to show that  $C_k(A)^T = C_k(A^T)$ .

#### 2.27.2 Implementation

- 1. For each row label I of  $C_k(A^T)$ , do the following:
  - (a) For each column label J of  $C_k(A^T)$ , do the following:
    - i. Using procedure 26, verify that  $(C_k(A^T))_{\underline{I},\underline{J}} = \det((A^T)_{I,J}) = \det(A_{J,I}) = (C_k(A))_{\underline{J},\underline{I}}.$
- 2. Therefore verify that  $(C_k(A))^T = (C_k(A^T))$ .

## 2.28 Procedure 28 (Linear system solution construction)

#### 2.28.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q})$ , A, and a  $\mathcal{M}_{m,p}(\mathbb{Q})$ , B. Execute procedure 21 on A and let  $\langle M, D, N \rangle$  receive the result. If the indices of the rows of D that are entirely zero are also the indices of the rows of MB that are entirely zero, then the objective of the following instructions is to construct a  $\mathcal{M}_{n,p}(\mathbb{Q})$  E such that AE = B.

#### 2.28.2 Implementation

- 1. Verify that  $A = M^{-1}DN^{-1}$ .
- 2. Verify that  $M^{-1}$ , D, and  $N^{-1}$  are  $\mathcal{M}_{*,*}(\mathbb{Q})$ s.
- 3. Let C be an  $n \times p$  matrix with its  $i^{th}$  row given as follows:
  - (a) If  $D_{i,i} \neq 0$ , then do the following:
    - i. Let row i be row i of MB divided by  $D_{i,i}$ .

- (b) Otherwise, do the following:
  - i. Choose p rational numbers to fill up the row.
- 4. Verify that DC = MB.
- 5. Let E be NC.
- 6. Therefore using procedure 6, verify that  $AE = M^{-1}DN^{-1}E = M^{-1}DN^{-1}NC = M^{-1}DI_nC = M^{-1}DC = M^{-1}MB = I_mB = B$ .
- 7. Yield the tuple  $\langle E \rangle$ .

The notation  $A \setminus B$  shall be used to refer to the result, E, of invoking procedure 28 on matrices A and B.

Make an analogous procedure to yield an F such that FA = B. The notation B/A shall be used to refer to the F yielded by invoking this procedure.

### 2.29 Procedure 29

#### 2.29.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q})$ , A, a  $\mathcal{M}_{n,p}(\mathbb{Q})$ , E, and a  $\mathcal{M}_{m,p}(\mathbb{Q})$ , B such that AE = B. Execute procedure 21 on A and let  $\langle M, D, N \rangle$  receive the result. If the indices of the rows of D that are entirely zero are not also the indices of the rows of  $M_*B$  that are entirely zero, then the objective of the following instructions is to show that  $0 \neq 0$ .

#### 2.29.2 Implementation

- 1. Verify that  $M^{-1}_*DN^{-1}_*E = AE = B$ .
- 2. Therefore verify that  $DN^{-1} *E = M_*B$ .
- 3. Let i be an integer such that  $D_{i,*}$  is zero and yet  $(M_*B)_{i,*}$  is not zero.
- 4. Verify that  $D_{i,*} = D_{i,*}N^{-1}_*E = (DN^{-1}_*E)_{i,*} = (M_*B)_{i,*}$ .
- 5. Let j be an integer such that  $(M_*B)_{i,j} \neq 0$ .
- 6. Now verify that  $0 = D_{i,j} = (M_*B)_{i,j} \neq 0$ .

### 2.30 Procedure 30

#### 2.30.1 Objective

Choose two  $\mathcal{M}_{m,m}(\mathbb{Q})$ s, A and B, such that  $AB = I_m$ . The objective of the following instructions is to show that either 0 = 1 or  $BA = I_m$ .

### 2.30.2 Implementation

- 1. Execute procedure 5 on B and let  $\langle M^{-1}, D, N^{-1} \rangle$  receive the result.
- 2. Verify that  $B = M^{-1} *DN^{-1} *$ .
- 3. If D has a zero on its diagonal, then do the following:
  - (a) Using procedure 23, verify that  $\det(I_m) = \det(AB) = \det(A)\det(B) = \det(A)\det(B) = \det(A) \det(B) = \det(A) \det(B) = 0$ .
  - (b) Using procedure 11, verify that  $det(I_m) = 1^m = 1$ .
  - (c) Verify that 0 = 1.
  - (d) Abort procedure.
- 4. Otherwise do the following:
  - (a) Verify that D does not have a zero on its diagonal.
  - (b) Verify that  $B \setminus I_m = I_m(B \setminus I_m) = AB(B \setminus I_m) = A(B(B \setminus I_m)) = AI_m = A$ .
  - (c) Therefore verify that  $BA = B(B \setminus I_m) = I_m$ .

## 2.31 Procedure 31

#### 2.31.1 Objective

Choose an  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , M, and an  $\mathcal{M}_{m,m}(\mathbb{Q})$ , B. The objective of the following instructions is to construct a  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ , Q, and a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , R, such that  $M = (xI_m - B)Q + R$ .

#### 2.31.2 Implementation

- 1. Let  $M_0x^b + M_1x^{b-1} + \cdots + M_bx^0 = M$ , where the  $M_i$  are  $\mathcal{M}_{m,m}(\mathbb{Q})$ s.
- 2. Now let  $R = B^b M_0 + B^{b-1} M_1 + \dots + B^0 M_b$ .

- 3. Let  $Q = \sum_{k=1}^{b} (x^{k-1}I_mB^0 + x^{k-2}I_mB^1 + \cdots + x^0I_mB^{k-1})M_k$ .
- 4. Verify that  $M R = (xI_m B)\sum_{k=1}^{b} (x^{k-1}I_mB^0 + x^{k-2}I_mB^1 + \cdots + x^0I_mB^{k-1})M_k = (xI_m B)Q.$
- 5. Verify that  $M = (xI_m B)Q + R$ .
- 6. Yield the tuple  $\langle Q, R \rangle$ .

Make an analogous procedure that instead has the objective of constructing a Q and R such that  $M=Q(xI_m-B)+R$ .

### 2.32 Procedure 32

#### 2.32.1 Objective

Choose two  $\mathcal{M}_{m,m}(\mathbb{Q})$ s, B,A, and two lists of  $\mathcal{T}_m(\mathbb{Q}[x])$ s such that  $xI_m - B = M(xI_m - A)N$ . The objective of the following instructions is to construct  $\mathcal{M}_{m,m}(\mathbb{Q})$ s  $R_1$  and  $R_3$  such that  $I_m = R_1R_3$  and  $B = R_1AR_3$ .

#### 2.32.2 Implementation

- 1. Verify that  $(xI_m B)N^{-1} = M(xI_m A)NN^{-1} = M(xI_m A)I_m = M(xI_m A)$ .
- 2. Execute procedure 31 on  $\langle M, B \rangle$  and let  $\langle Q_1, R_1 \rangle$  receive.
- 3. Verify that  $M = (xI_m B)Q_1 + R_1$ .
- 4. Execute procedure 31 on  $\langle N^{-1}, A \rangle$  and let  $\langle Q_2, R_2 \rangle$  receive.
- 5. Verify that  $N^{-1} = Q_2(xI_m A) + R_2$ .
- 6. By substituting M and  $N^{-1}$  into (2), verify that  $(xI_m B)(Q_2(xI_m A) + R_2) = ((xI_m B)Q_1 + R_1)(xI_m A)$ .
- 7. By rearranging both sides, verify that  $(xI_m B)(Q_2 Q_1)(xI_m A) = R_1(xI_m A) (xI_m B)R_2$ .
- 8. By equating the coefficients of different powers of x both sides, verify that  $Q_2 Q_1 = 0_{m \times m}$ .
- 9. Verify that  $R_1(xI_m A) (xI_m B)R_2 = (xI_m B)(Q_2 Q_1)(xI_m A) = (xI_m B)0_{m \times m}(xI_m A) = 0_{m \times m}$ .

- 10. Therefore by adding  $(xI_m B)R_2$  to both sides, verify that  $xR_1 R_1A = R_1(xI_m A) = (xI_m B)R_2 = xR_2 BR_2$ .
- 11. By equating the coefficients of x on both sides, verify that  $R_1 = R_2$ .
- 12. Therefore verify that  $R_1A = BR_1$ .
- 13. Execute procedure 31 on  $\langle M^{-1}, A \rangle$  and let  $\langle Q_3, R_3 \rangle$  receive.
- 14. Verify that  $M^{-1} = (xI_m A)Q_3 + R_3$ .
- 15. Verify that  $I_m = MM^{-1} = ((xI_m B)Q_1 + R_1)M^{-1} = (xI_m B)Q_1M^{-1} + R_1M^{-1} = (xI_m B)Q_1M^{-1} + R_1(xI A)Q_3 + R_1R_3 = (xI_m B)Q_1M^{-1} + (xI B)R_1Q_3 + R_1R_3 = (xI_m B)(Q_1M^{-1} + R_1Q_3) + R_1R_3.$
- 16. By equating the powers of x on both sides, verify that  $Q_1M^{-1} + R_1Q_3 = 0$ .
- 17. By substituting zero for  $Q_1M^{-1} + R_1Q_3$ , verify that  $I_m = (xI_m B)0_{m \times m} + R_1R_3 = R_1R_3$ .
- 18. Therefore using procedure 30, verify that  $R_3R_1 = I_m$ .
- 19. Also, verify that  $B = BI_m = BR_1R_3 = R_1AR_3$ .
- 20. Yield the pair  $(R_1, R_3)$ .

#### 2.33 Procedure 33

#### 2.33.1 Objective

Choose a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ , A. Choose two integers  $1 \leq i, j \leq m$  such that  $i \neq j$ . The objective of the following instructions is to negate row i and swap it with row j using only elementary row and column operations.

#### 2.33.2 Implementation

- 1. Let A be our working matrix.
- 2. Subtract row j from row i.
- 3. Add row i to row j.
- 4. Subtract row j from row i.
- 5. Verify that the  $i^{th}$  row has been negated and swapped with the  $j^{th}$  row.

Make an analogous procedure to negate column i and swap it with column j.

#### 2.34 Procedure 34

#### 2.34.1 Objective

Choose a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ , A. Choose two integers  $1 \leq i, j \leq \min(m, n)$  such that  $i \neq j$ . The objective of the following instructions is to swap  $B_{i,i}$  and  $B_{j,j}$  using only elementary row and column operations.

### 2.34.2 Implementation

- 1. Let A be our working matrix.
- 2. Use procedure 33 to negate the  $i^{th}$  row and swap it with the  $j^{th}$  row.
- 3. Use procedure 33 to negate the  $i^{th}$  column and swap it with the  $j^{th}$  column.
- 4. Therefore, overall verify that  $B_{i,i}$  and  $B_{j,j}$  have been swapped.

#### 2.35 Procedure 35

#### 2.35.1 Objective

Choose a  $\mathcal{D}_{m,n}(\mathbb{Q}[x])$ , A. Choose two integers  $1 \leq i, j \leq \min(m, n)$  such that  $i \neq j$ . Choose a rational  $k \neq 0$ . The objective of the following instructions is to multiply  $B_{i,i}$  by k and  $B_{j,j}$  by  $\frac{1}{k}$  using only elementary row and column operations.

#### 2.35.2 Implementation

- 1. Let A be our working matrix.
- 2. Add k times row i to row j.
- 3. Subtract  $\frac{1}{k}$  times row j from row i.
- 4. Add k times row i to row j.
- 5. Verify that the  $i^{th}$  row has been scaled by k, the  $j^{th}$  row by  $-\frac{1}{k}$ , and that both these rows are swapped.
- 6. Use procedure 33 to negate the  $i^{th}$  row and swap it with the  $j^{th}$  row.

7. Therefore, overall verify that  $B_{i,i}$  has been 2.37.2 Implementation multiplied by k, and  $B_{j,j}$  by  $\frac{1}{k}$ .

#### 2.36 Procedure 36

#### **Objective** 2.36.1

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 10 on the polynomial matrix xI - A and let  $\langle B \rangle$  be the result. The objective of the following instructions is to show that either none of the diagonal entries of B are equal to zero, or 1 = 0.

#### 2.36.2Implementation

- 1. Using procedure 11, verify that det(xI A) is a monic polynomial of degree m.
- 2. Therefore verify that det(B) = det(xI A) is a monic polynomial of degree m.
- 3. If any of the diagonal entries of B equal zero, then do the following:
  - (a) Using procedure 11, verify that det(B) = $B_{1,1}B_{2,2}\cdots B_{m,m}=0.$
  - (b) Therefore verify that 1 = 0.
  - (c) Abort procedure.
- 4. Otherwise do the following:
  - (a) Verify that none of the diagonal entries of B equal zero.

Let us use the notation [P] as a shorthand for "if P, then yield 1, otherwise yield 0".

Let us use the notation cols(A) as a shorthand for "the number of columns of A".

Let us use the notation rows(A) as a shorthand for "the number of rows of A".

#### 2.37Procedure 37 (Block diagonal construction)

#### 2.37.1**Objective**

Choose a list of  $\mathcal{M}_*(\mathbb{Q})$ , C. Let  $m = \sum_{i=1}^{|C|} \operatorname{cols}(C_i)$ . The objective of the following instructions is to define the  $\mathcal{M}_{m,m}(\mathbb{Q})$ ,  $\operatorname{bdiag}(C)$ .

- 1. Let E be a  $0 \times 0$  matrices.
- 2. Now for i = 1 to i = |C|:
  - (a) Add  $cols(C_i)$  columns filled with zeros to the right end of E.
  - (b) Add  $cols(C_i)$  rows filled with zeros to the bottom end of E.
  - (c) Set the bottom-right corner of E equal to
- 3. Verify that  $cols(E) = \sum_{i=1}^{|C|} cols(C_i) = m$ .
- 4. Yield the tuple  $\langle E \rangle$ .

#### Procedure 38 2.38

#### Objective 2.38.1

Choose a positive integer m and an  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 21 on the polynomial matrix  $xI_m - A$  and let  $\langle B, v, \rangle$  be the result. The objective of the following instructions is to either show that 0 < 0 or to construct an integer a such that  $\sum_{i=a}^{m} \deg(B_{i,i}) = m, \deg(B_{i,i}) > 0 \text{ for } i = a \text{ to}$ i = m, and  $deg(B_{i,i}) = 0$  for i = 1 to i = a - 1.

#### 2.38.2Implementation

- 1. Execute procedure 36 on A.
- 2. If  $deg(B_{i,i}) = 0$  for i = 1 to i = m, then do the following:
  - (a) Verify that  $det(xI_m A) = det(B) =$  $B_{1,1}B_{2,2}\cdots B_{m,m}$ .
  - (b) Therefore verify that  $\deg(\det(xI_m - A))$  $\deg(B_{1,1}B_{2,2}\cdots B_{m,m}) = 0 + 0 + \cdots + 0 = 0.$
  - (c) Abort procedure.
- 3. Otherwise do the following:
  - (a) Let  $1 \le a \le m$  be the least integer such that  $deg(B_{a,a}) > 0$ .
  - (b) Verify that  $deg(B_{i,i}) = 0$  for i = 1 to i = a - 1.

- (c) Verify that  $\sum_{i=a}^{m} \deg(B_{i,i}) = \sum_{i=1}^{m} \deg(B_{i,i}) = \deg(B_{1,1}B_{2,2}\cdots B_{m,m}) = \deg(\det(B)) = \deg(xI_m A) = m.$
- (d) For i = a + 1 to i = m, do the following:
  - i. Verify that  $B_{i,i} = u_i B_{i-1,i-1}$ .
  - ii. Verify that  $B_{i,i} \neq 0$ .
  - iii. Therefore verify that  $u_i \neq 0$ .
  - iv. Therefore verify that  $deg(B_{i,i}) = deg(u_i B_{i-1,i-1}) \ge deg(B_{i-1,i-1}) > 0$ .
- (e) Yield the tuple  $\langle a \rangle$ .

## 2.39 Procedure 39 (Rational canonical form construction)

#### 2.39.1 Objective

Choose a  $\mathbb{Q}[x]$ ,  $p = x^k + p_1 x^{k-1} + p_2 x^{k-2} + \cdots + p_k x^0$  such that k > 0. The objective of the following instructions is to define the  $\mathcal{M}_{k,k}(\mathbb{Q})$ , rcan(p).

#### 2.39.2 Implementation

- 1. Make a  $k \times k$  matrix C.
- 2. Let C's first k-1 columns be filled with the last k-1 columns of  $I_k$ .
- 3. Let C's last column from top to bottom be  $-p_k, -p_{k-1}, \dots, -p_1$ .
- 4. Yield the tuple  $\langle C \rangle$ .

#### 2.40 Procedure 40

#### 2.40.1 Objective

Choose a monic  $\mathbb{Q}[x]$ , p such that  $\deg(p) > 0$ . Let  $k = \deg(p)$ . Choose a  $\mathcal{M}_{k,k}(\mathbb{Q}[x])$ , D, such that  $D = xI_k - \operatorname{rcan}(p)$ . The objective of the following instructions is to transform D into  $\operatorname{bdiag}(1, \dots, 1, p)$  by a sequence of elementary operations.

#### 2.40.2 Implementation

- 1. Let the matrix D be our working matrix.
- 2. For i = k going down to i = 2, add x times row i to row i 1.
- 3. Verify that D's first k-1 columns are now the last k-1 columns of  $-I_k$ .
- 4. Verify that D's last column is p followed by some other polynomials.
- 5. For i = 2 going up to i = k, subtract  $D_{i,k}$  times column i 1 from column k.
- Verify that D's last column is now p followed by zeros.
- 7. For i = 2 going up to i = k, negate row i 1 and exchange it with row i using procedure 33.
- 8. Therefore verify that  $D = \text{bdiag}(1, \dots, 1, p)$ .

Let us use the notation mon(p) as a shorthand for " $\frac{p}{x^{\deg(p)} \circ p}$ " in what follows.

### 2.41 Procedure 41

#### 2.41.1 Objective

Choose a positive integer m and an  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 4 on the polynomial matrix  $xI_m - A$  and let  $\langle B, , \rangle$  receive the result. Execute procedure 38 on A and let  $\langle a \rangle$  receive the result. Let  $E_i = \operatorname{rcan}(\operatorname{mon}(B_{a-1+i,a-1+i}))$  for i=1 to i=m+1-a. The objective of the following instructions is to first show that  $\operatorname{cols}(\operatorname{bdiag}(E)) = m$ , and second to apply a sequence of elementary operations on  $xI_m - \operatorname{bdiag}(E)$  to obtain the matrix B.

#### 2.41.2 Implementation

- 1. Verify that the diagonal of B comprises x-1 rationals followed by  $B_{a,a}, B_{a+1,a+1}, \dots, B_{m,m}$ .
- 2. Using procedure 40, verify that  $\operatorname{cols}(\operatorname{bdiag}(E)) = \sum_{i=1}^{|E|} \operatorname{cols}(E_i) = \sum_{i=1}^{|E|} \operatorname{cols}(\operatorname{rcan}(\operatorname{mon}(B_{a-1+i,a-1+i}))) = \sum_{i=1}^{|E|} \operatorname{deg}(\operatorname{mon}(B_{a-1+i,a-1+i})) = \sum_{i=1}^{m+1-a} \operatorname{deg}(B_{a-1+i,a-1+i}) = \sum_{i=a}^{m} \operatorname{deg}(B_{i,i}) = m.$
- 3. Let  $F = xI_m \text{bdiag}(E)$ .

- 4. Now for i = 1 to i = |E|:
  - (a) Let  $j = 1 + \sum_{r=1}^{i-1} \text{cols}(E_r)$ .
  - (b) Let  $k = j + \operatorname{cols}(E_i)$ .
  - (c) Apply procedure 40 on the tuple  $\langle \text{mon}(B_{a-1+i,a-1+i}), F_{[j:k],[j:k]} \rangle$ .
- 5. Now verify that F is a  $\mathcal{D}_{m,m}(\mathbb{Q})$ .
- 6. Also verify that the diagonal of F comprises  $mon(B_{a,a}), mon(B_{a+1,a+1}), \cdots, mon(B_{m,m})$  and a-1 1s.
- 7. Rearrange the diagonal of F so that  $mon(B_{i,i})$  is at the  $i^{th}$  position on the diagonal for i = a to i = m by doing pairwise swaps. In general, swap the  $i^{th}$  and  $j^{th}$  diagonal entries using procedure 34
- 8. For i = 1 to i = m 1, do the following:
  - (a) Let  $k = \frac{x^{\deg(B_{i,i})} \circ B_{i,i}}{x^{\deg(F_{i,i})} \circ F_{i,i}}$ .
  - (b) Scale  $B_{i,i}$  by k and  $B_{i+1,i+1}$  by  $\frac{1}{k}$  using procedure 35.
  - (c) Now verify that  $F_{i,i} = B_{i,i}$ .
- 9. Now verify that  $x^m \circ \det(F) = x^m \circ \det(xI_m b\operatorname{diag}(E)) = 1 = x^m \circ \det(xI_m A) = x^m \circ \det(B)$ .
- 10. Therefore verify that  $x^{\deg(F_{m,m})} \circ F_{m,m} = \frac{x^m \circ \det(F)}{x^{m-\deg(F_{m,m})} \circ (\det(F_{[1:m],[1:m]}))} = \frac{x^m \circ \det(B)}{x^{m-\deg(B_{m,m})} \circ (\det(B_{[1:m],[1:m]}))} = x^{\deg(B_{m,m})} \circ B_{m,m}.$
- 11. Therefore verify that  $F_{m,m} = B_{m,m}$ .
- 12. Therefore verify that F = B.

#### 2.42 Procedure 42

#### 2.42.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 38 on A and let  $\langle a \rangle$  receive the result. Let  $E_i = \text{rcan}(\text{mon}(B_{a-1+i,a-1+i}))$  for i=1 to i=m+1-a. The objective of the following instructions is to construct  $\mathcal{M}_{m,m}(\mathbb{Q})$ s R,T such that A=R bdiag(E)T,  $RT=I_m$ , and  $TR=I_m$ .

#### 2.42.2 Implementation

- 1. Execute procedure 21 on the polynomial matrix  $xI_m A$  and let  $\langle P, B, Q \rangle$  be the result.
- 2. Verify that  $P_*(xI_m A)Q_* = B$ .
- 3. Verify that  $xI_m A = P^{-1} *BQ^{-1} *$ .
- 4. Let Z be a variant of procedure 21 where every occurrence of procedure 10 in its instructions is replaced with procedure 41, and where every mention of v is ignored.
- 5. Execute procedure Z on the matrix  $xI_m$  bdiag(E) and let  $\langle M, , , N \rangle$  receive the result.
- 6. Verify that  $M_*(xI_m \text{bdiag}(E))N_* = B$ .
- 7. Verify that  $xI_m A = P^{-1} {}_*BQ^{-1} {}_* = P^{-1} {}_*M(xI_m \text{bdiag}(E))NQ^{-1} {}_*.$
- 8. Execute procedure 32 on the matrices  $\langle A, P^{-1}M, \text{bdiag}(E), NQ^{-1} \rangle$ . Let the tuple  $\langle R, T \rangle$  be the result.
- 9. Verify that  $A = R \operatorname{bdiag}(E)T$ .
- 10. Verify that  $RT = I_m$ .
- 11. Verify that  $TR = I_m$ .
- 12. Yield the tuple  $\langle R, E, T \rangle$ .

## 2.43 Procedure 43

#### 2.43.1 Objective

Choose a  $\mathbb{Q}[x]$ ,  $r = r_0 x^t + r_1 x^{t-1} + \cdots + r_t x^0$ , and  $\mathcal{M}_{m,m}(\mathbb{Q})$ s, R, A, S such that  $SR = I_m$ . The objective of the following instructions is to show that r(RAS) = Rr(A)S.

#### 2.43.2 Implementation

1. Verify that  $r(RAS) = r_0(RAS)^t + r_1(RAS)^{t-1} + \cdots + r_t(RAS)^0 = r_0RA^tS + r_1RA^{t-1}S + \cdots + r_tRA^0S = R(r_0A^t + r_1A^{t-1} + \cdots + r_tA^0)S = Rr(A)S$ .

#### 2.44 Procedure 44

#### 2.44.1 Objective

Choose a list of  $\mathcal{M}_{m,m}(\mathbb{Q})$ s, A, and a  $\mathbb{Q}[x]$ ,  $r = r_0 x^t + r_1 x^{t-1} + \cdots + r_t x^0$ . The objective of the following instructions is to show that r(bdiag(A)) = bdiag(r(A)).

#### 2.44.2 Implementation

- 1. For i = 0 up to i = t, by repeated applications of procedure 9, verify that  $\operatorname{bdiag}(A)^i$  evaluates to  $\operatorname{bdiag}(A^i)$  (where the exponentiation is done element-wise).
- 2. Therefore verify that  $r(\operatorname{bdiag}(A)) = r_0 \operatorname{bdiag}(A)^t + r_1 \operatorname{bdiag}(A)^{t-1} + \cdots + r_t \operatorname{bdiag}(A)^0 = r_0 \operatorname{bdiag}(A^t) + r_1 \operatorname{bdiag}(A^{t-1}) + \cdots + r_t \operatorname{bdiag}(A^0) = \operatorname{bdiag}(r_0 A^t) + \operatorname{bdiag}(r_1 A^{t-1}) + \cdots + \operatorname{bdiag}(r_t A^0) = \operatorname{bdiag}(r(A))$  (where r is applied element-wise).

## 2.45 Procedure 45

#### 2.45.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A, and a  $\mathbb{Q}[x]$ , r. Execute procedure 42 on the matrix A and let the tuple  $\langle R_1, E, R_3 \rangle$  receive the result. The objective of the following instructions is to show that  $r(A) = R_1 \operatorname{bdiag}(r(E))R_3$  (where r is applied element-wise).

#### 2.45.2 Implementation

- 1. Verify that  $R_3R_1 = I_m$ .
- 2. Using procedure 43, verify that  $r(A) = r(R_1 \operatorname{bdiag}(E)R_3) = R_1 r(\operatorname{bdiag}(E))R_3$ .
- 3. Using procedure 44, verify that r(bdiag(E)) = bdiag(r(E)) (where r is applied element-wise).
- 4. Therefore verify that  $r(A) = R_1 \operatorname{bdiag}(r(E))R_3$  (where r is applied element-wise).

Let us use the notation  $e_i$  as a shorthand for "the  $\mathcal{M}_{k,1}(\mathbb{Q})$  that is 0, except for its  $i^{th}$  entry which is 1".

Let us use the notation  $0_{m\times n}$  as a shorthand for "the  $\mathcal{M}_{m,m}(\mathbb{Q})$  such that every entry is 0".

#### 2.46 Procedure 46

#### 2.46.1 Objective

Choose a  $\mathbb{Q}[x]$   $p = x^k + p_1 x^{k-1} + p_2 x^{k-2} + \cdots + p_k x^0$  such that k > 0. The objective of the following instructions is to show that  $p(\operatorname{rcan}(p)) = 0_{k \times k}$ .

#### 2.46.2 Implementation

- 1. Let  $G = \operatorname{rcan}(p)$ .
- 2. Then by G's construction, for i = 1 up to i = k, verify that  $G^{i-1}e_1 = G^{i-2}e_2 = \cdots = G^0e_i = e_i$ .
- 3. Therefore, for i=1 up to i=k: Cognizant of the construction of G's last column, verify that  $p(G)e_i=(G^k+p_1G^{k-1}+p_2G^{k-2}+\cdots+p_kG^0)e_i=(G^k+p_1G^{k-1}+p_2G^{k-2}+\cdots+p_kG^0)G^{i-1}e_1=G^{i-1}(GG^{k-1}+p_1G^{k-1}+p_2G^{k-2}+\cdots+p_kG^0)e_1=G^{i-1}(Ge_k+p_1e_k+p_2e_{k-1}+\cdots+p_ke_1)=G^{i-1}0_{k\times 1}=0_{k\times 1}.$
- 4. Therefore verify that  $p(G) = 0_{k \times k}$ .

#### 2.47 Procedure 47

#### 2.47.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to define the  $\mathbb{Q}[x]$  last<sub>A</sub> and show that either 1 = 0 or last<sub>A</sub>  $\neq 0$ .

#### 2.47.2 Implementation

- 1. Execute procedure 21 on the polynomial matrix  $xI_m A$  and let the tuple  $\langle B, \rangle$  receive the result.
- 2. Execute procedure 36 on A.
- 3. Verify that  $B_{m,m} \neq 0$ .
- 4. Yield  $\langle B_{m,m} \rangle$ .

#### 2.48 Procedure 48

#### 2.48.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to show that  $\operatorname{last}_A(A) = 0_{m \times m}$ .

#### 2.48.2 Implementation

- 1. Execute procedure 21 on the matrix A and let the tuple  $\langle M, B, v, N \rangle$  receive the result.
- 2. Execute procedure 38 on A and let  $\langle a \rangle$  receive.
- 3. Execute procedure 42 on A and let  $\langle R, E, T \rangle$  receive.
- 4. For j = 1 to j = |E|:
  - (a) Verify that  $E_j$  rcan(mon( $B_{a-1+j,a-1+j}$ )).
  - (b) Verify that  $last_A = B_{m,m}$  $B_{a-1+j,a-1+j}v_{a+j}v_{a+j+1}\cdots v_m$ .
  - (c) Let  $k = \deg(\min(B_{a-1+j,a-1+j}))$ .
  - (d) Therefore using procedure 46 verify that  $\operatorname{last}_A(E_j) = B_{m,m}(E_j) = B_{a-1+j,a-1+j}(\operatorname{rcan}(\operatorname{mon}(B_{a-1+j,a-1+j}))) \cdot v_{a+j}(E_j)v_{a+j+1}(E_j)\cdots v_m(E_j) = 0_{k\times k}v_{a+j}(E_j)v_{a+j+1}(E_j)\cdots v_m(E_j) = 0_{k\times k}.$
- 5. Therefore using procedure 45 verify that  $last_A(A) = R \operatorname{bdiag}(last_A(E))T = R \operatorname{bdiag}(B_{m,m}(E))T = R0_{m \times m}T = 0_{m \times m}.$

#### 2.49 Procedure 49

#### 2.49.1 Objective

Choose a monic  $\mathbb{Q}[x]$  p such that  $\deg(p) > 0$ . Choose a  $\mathbb{Q}[x]$   $g = g_0 x^k + g_1 x^{k-1} + \cdots + g_k x^0$  such that  $g_0 \neq 0$  and  $k < \deg(p)$ . The objective of the following instructions is to show that  $g(\operatorname{rcan}(p)) \neq 0_{\deg(p) \times \deg(p)}$ .

## 2.49.2 Implementation

- 1. Let  $G = \operatorname{rcan}(p)$ .
- 2. Therefore cognizant of G's construction, verify that  $g(G)e_1 = (g_0G^k + g_1G^{k-1} + \cdots + g_kG^0)e_1 = g_0e_{k+1} + g_1e_k + \cdots + g_we_1 \neq 0_{\deg(p)\times 1}$ .
- 3. Therefore verify that  $g(G) \neq 0_{\deg(p) \times \deg(p)}$ .

#### 2.50 Procedure 50

#### 2.50.1 Objective

Choose two  $\mathbb{Q}[x]$ s  $g = g_0 x^k + g_1 x^{k-1} + \cdots + g_k x^0$ ,  $p = x^k + p_1 x^{k-1} + p_2 x^{k-2} + \cdots + p_k x^0$  such that  $\deg(p) = \deg(g) > 0$  and  $g(\operatorname{rcan}(p)) = 0_{\deg(p) \times \deg(p)}$ . The objective of the following instructions is to show that  $g = g_0 p$ .

#### 2.50.2 Implementation

- 1. Let  $G = \operatorname{rcan}(p)$ .
- 2. Let  $u = \deg(g)$ .
- 3. Cognizant of G's construction, verify that  $0_{u\times 1} = g(G)e_1 = (g_0G^u + g_1G^{u-1} + g_2G^{u-2} + \cdots + g_uG^0)e_1 = g_0Ge_u + g_1e_u + g_2e_{u-1} + \cdots + g_ue_1.$
- 4. Therefore for i = 1 to i = u, do the following:
  - (a) Verify that  $0 = (g_0 G e_u + g_1 e_u + g_2 e_{u-1} + \cdots + g_u e_1)_{i,1}$ .
  - (b) Therefore cognizant of G's construction, verify that  $-g_0p_{u+1-i} + g_{u+1-i} = 0$ .
  - (c) Therefore verify that  $g_{u+1-i} = g_0 p_{u+1-i}$ .
- 5. Therefore verify that  $g = g_0 p$ .

#### 2.51 Procedure 51

#### 2.51.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Choose a  $\mathbb{Q}[x]$   $p=p_0x^t+p_1x^{t-1}+p_2x^{t-2}+\cdots+p_tx^0$  where  $p_0\neq 0$ , such that  $p(A)=0_{m\times m}$ . The objective of the following instructions is to either show that  $0\neq 0$  or to construct a  $\mathbb{Q}[x]$  f such that p=f last<sub>A</sub>.

#### 2.51.2 Implementation

- 1. Let F be a  $1 \times 2$  matrix consisting in-order of p and last<sub>A</sub>.
- 2. Execute procedure 21 on F and let  $\langle M, D, N \rangle$  receive the result.
- 3. Verify that  $D_{1,1} \neq 0$ .
- 4. Let  $g = g_0 x^w + g_1 x^{w-1} + g_2 x^{w-2} + \dots + g_w x^0 = D_{1,1}$  in such a way that  $g_0 \neq 0$ .

- 5. Verify that  $F = M^{-1}DN^{-1} = DN^{-1}$ .
- 6. Verify that  $\operatorname{last}_A = F_{1,2} = D_{1,1}N^{-1}_{1,2} + D_{1,2}N^{-1}_{2,2} = D_{1,1}N^{-1}_{1,2} = gN^{-1}_{1,2}$ .
- 7. Let  $u = last_A$ .
- 8. Therefore verify that  $N^{-1}_{1,2} \neq 0$ .
- 9. Therefore verify that  $u = \deg(\operatorname{last}_A)$   $\deg(D_{1,1}N^{-1}_{1,2}) \ge \deg(D_{1,1}) = \deg(g) = w$ .
- 10. Verify that D = MFN = FN.
- 11. Therefore verify that  $g = D_{1,1} = N_{1,1}p + N_{2,1} \operatorname{last}_A$ .
- 12. Therefore using procedure 46, verify that  $g(A) = N_{1,1}(A)p(A) + N_{2,1}(A) \operatorname{last}_A(A) = N_{1,1}(A)0_{m \times m} + N_{2,1}(A)0_{m \times m} = 0_{m \times m}.$
- 13. Execute procedure 42 on the matrix A and let the tuple  $\langle R_1, E, R_3 \rangle$  receive the result.
- 14. Using procedure 45, and procedure 42, verify that  $\operatorname{bdiag}(g(E)) = I_m \operatorname{bdiag}(g(E))I_m = R_3R_1 \operatorname{bdiag}(g(E))R_3R_1 = R_3g(A)R_1 = R_30_{m\times m}R_1 = 0_{m\times m}.$
- 15. Let  $G = \text{rcan}(\text{mon}(\text{last}_A))$ .
- 16. Verify that  $g(G) = g(E_{|E|})$  bdiag $(g(E))_{[m-u+1:m+1],[m-u+1:m+1]} = 0_{u \times u}$ .
- 17. If w < u, then:
  - (a) Using procedure 49, verify that  $g(G) \neq 0_{u \times u}$ .
  - (b) Abort procedure.
- 18. Otherwise, do the following:
  - (a) Verify that w = u.
  - (b) Using procedure 50, verify that  $g = g_0 \operatorname{last}_A$ .
  - (c) Therefore verify that  $p = F_{1,1} = D_{1,1}N^{-1}_{1,1} + D_{1,2}N^{-1}_{2,1} = N^{-1}_{1,1}g + N^{-1}_{2,1} * 0 = N^{-1}_{1,1}g = N^{-1}_{1,1}g_0 \operatorname{last}_A$ .
  - (d) Yield the tuple  $\langle N^{-1}_{1,1}g_0\rangle$ .

## 2.52 Procedure 52 (Difference of powers)

### 2.52.1 Objective

Choose an integer  $n \geq 0$  and a  $\mathbb{Q}[x]$   $p = p_0 x^n + p_1 x^{n-1} + \cdots + p_n$ . Let y, z be indeterminates. The objective of the following instructions is to construct a  $\mathbb{Q}[y, z]$  G such that p(z) - p(y) = (z - y)G(y, z).

#### 2.52.2 Implementation

- 1. Let the  $\mathbb{Q}[y,z]$   $G = \sum_{r=1}^{n} p_{n-r}(z^{r-1} + z^{r-2}y + \cdots + zy^{r-2} + y^{r-1})$ .
- 2. Verify that p(z) p(y)
  - (a) =  $(p_0 z^n + p_1 z^{n-1} + \dots + p_n) (p_0 y^n + p_1 y^{n-1} + \dots + p_n)$
  - (b) =  $\left(\sum_{r=0}^{n} p_{n-r} z^{r}\right) \left(\sum_{r=0}^{n} p_{n-r} y^{r}\right)$
  - (c) =  $\sum_{r=1}^{n} p_{n-r}(z^r y^r)$
  - (d)  $= \sum_{r=1}^{n} p_{n-r}(z-y)(z^{r-1} + z^{r-2}y + \dots + zy^{r-2} + y^{r-1})$
  - (e) =  $(z-y)\sum_{r=1}^{n} p_{n-r}(z^{r-1} + z^{r-2}y + \dots + zy^{r-2} + y^{r-1})$
  - (f) = (z y)G(y, z).
- 3. Yield the tuple  $\langle G \rangle$ .

#### 2.53 Procedure 53

#### 2.53.1 Objective

Choose a  $\mathbb{Q}[x]$   $p = x^n + p_1 x^{n-1} + \cdots + p_n$  and  $\mathbb{Q}$ s  $a_1 < a_2 < \cdots < a_n < a_{n+1}$  in such a way that for i = 1 to i = n + 1,  $p(a_i) = 0$ . The objective of the following instructions is to show that  $0 \neq 0$ .

#### 2.53.2 Implementation

- 1. Write p as 1 \* p, so that it has two factors.
- 2. For i = 1 up to i = n, do the following:
  - (a) Let g be the rightmost factor of p.
  - (b) If  $q(a_i) \neq 0$ , do the following:
    - i. For k = 1 to k = i 1, verify that  $(a_i a_k) \neq 0$ .

- ii. Verify that  $p(a_i) \neq 0$ .
- iii. Therefore verify that  $0 \neq 0$ .
- iv. Abort procedure.
- (c) Otherwise  $g(a_i) = 0$ . Now do the following:
  - i. Execute procedure 52 on g and let the tuple  $\langle G \rangle$  receive the result.
  - ii. Let x be an indeterminate.
  - iii. Let the  $\mathbb{Q}[x]$   $q = q(x) = G(a_i, x)$ .
  - iv. Verify that the  $\mathbb{Q}[x]$   $g = g(x) = g(x) g(a_i) = (x a_i)G(a_i, x) = (x a_i)q(x) = (x a_i)q$ .
  - v. Verify that  $p = (x a_1)(x a_2) \cdots (x a_i)q$ .
- 3. Now verify that  $p = (x-a_1)(x-a_2)\cdots(x-a_n)1$ .
- 4. Using (3), verify that  $p(a_{n+1}) \neq 0$ .
- 5. Therefore verify that  $0 \neq 0$ .
- 6. Abort procedure.

## 2.54 Procedure 54 (Bisection)

#### 2.54.1 Objective

Choose a  $\mathbb{Q}[x]$  f. Choose  $\mathbb{Q}$ s a < b such that  $\mathrm{sgn}(f(a)) = -\mathrm{sgn}(f(b))$ . Choose a rational number target B > 0. The objective of the following instructions is to construct a  $\mathbb{Q}$  d such that  $a \leq d \leq b$  and |f(d)| < B.

#### 2.54.2 Implementation

- 1. Execute procedure 52 on f and let the tuple  $\langle G \rangle$  receive the result.
- 2. Let x, y be indeterminates.
- 3. Verify that the  $\mathbb{Q}[x,y]$  f(y) f(x) = (y x)G(x,y).
- 4. Let c = a and d = b.
- 5. Until |d c||G|(|a|, |b|) < B
  - (a) Let  $e = \frac{c+d}{2}$ .
  - (b) If sgn(f(c)) = -sgn(f(e)), then:
    - i. Let d = e.

- (c) Otherwise if sgn(f(e)) = -sgn(f(d)), then:
  - i. Let c = e.
- (d) Otherwise if f(e) = 0, then do the following:
  - i. Verify that |f(e)| = 0 < B.
  - ii. Yield the tuple  $\langle e \rangle$ .
- 6. Verify that  $|f(c)|, |f(d)| < |f(d) f(c)| = |(d c)G(c,d)| = |d-c||G(c,d)| \le |d-c||G|(|c|,|d|) \le |d-c||G|(|a|,|b|) < B.$
- 7. Yield the tuple  $\langle c \rangle$ .

#### 2.55 Procedure 55

#### 2.55.1 Objective

Choose a  $\mathbb{Q}[x]$   $f = x^n + p_1 x^{n-1} + \cdots + p_n$  and pairs of  $\mathbb{Q}$ s  $(a_n, b_n), (a_{n-1}, b_{n-1}), \cdots, (a_0, b_0)$  in such a way that:

- 1.  $a_n < b_n \le a_{n-1} < b_{n-1} \le \dots \le a_1 < b_1 \le a_0 < b_0$ .
- 2.  $\operatorname{sgn}(f(a_i)) = -\operatorname{sgn}(f(b_i))$  for i = 0 to i = n.

The objective of the following instructions is to show that 1 = -1.

#### 2.55.2 Implementation

- 1. If n > 0:
  - (a) Let  $B = \min_{k=0}^{n-1} \min(|f(a_k)|, |f(b_k)|)$ .
  - (b) For k = 0 to k = n-1, verify that  $|f(a_k)| \ge B$ .
  - (c) Execute procedure 54 on the formal polynomial f, interval  $(a_n, b_n)$ , and target of B. Let the tuple  $\langle d \rangle$  receive the result.
  - (d) Verify that |f(d)| < B.
  - (e) Execute procedure 52 on the formal polynomial f and let the tuple  $\langle G \rangle$  receive the result.
  - (f) Let x be an indeterminate.
  - (g) Let the formal polynomial h = G(d, x).
  - (h) Verify that h is a monic  $(n-1)^{th}$  degree formal polynomial.

- (i) Verify that the formal polynomial f = f(x) = f(x) f(d) + f(d) = (x-d)G(d,x) + f(d) = (x-d)h(x) + f(d) = (x-d)h + f(d).
- (j) For k = 0 to k = n 1, do the following:
  - i. If  $f(a_k) \geq B$ , in-order verify that:
    - A.  $f(a_k) \ge B > |f(d)| \ge f(d)$ .
    - B.  $f(a_k) f(d) > 0$ .
    - C.  $(a_k d)h(a_k) > 0$ .
    - D.  $h(a_k) > 0$ .
    - E.  $f(b_k) \le -B < -|f(d)| \le f(d)$ .
    - F.  $f(b_k) f(d) < 0$ .
    - G.  $(b_k d)h(b_k) < 0$ .
    - H.  $h(b_k) < 0$ .
  - ii. Otherwise, if  $f(a_k) \leq -B$ , do the following:
    - A. Using steps analogous to (ji), verify that  $h(a_k) < 0$ .
    - B. Using steps analogous to (ji), verify that  $h(b_k) > 0$ .
- (k) Execute procedure 55 on h and  $a_{n-1} < b_{n-1} \le a_{n-2} < b_{n-2} \le \cdots \le a_1 < b_1 \le a_0 < b_0$ .
- 2. Otherwise, do the following:
  - (a) Verify that n = 0.
  - (b) Therefore verify that h = 1.
  - (c) Therefore verify that  $1 = \text{sgn}(1) = \text{sgn}(f_0(a_0)) = -\text{sgn}(f_0(b_0)) = -\text{sgn}(1) = -1$ .
  - (d) Abort procedure.

## 2.56 Procedure 56 (Sturm's procedure initialization)

#### 2.56.1 Objective

Choose two lists of  $\mathbb{Q}[x]$ s s,q in such a way that, letting m = |s| - 1,

- 1. For i = 0 to i = m,  $\deg(s_i) = i$ .
- 2. For i = 0 to i = m,  $\operatorname{sgn}(x^i \circ s_i) = \operatorname{sgn}(x^m \circ s_m)$ .

3. For i = 1 to i = m - 1,  $s_{i-1} + s_{i+1} = q_i s_i$ .

Let x, y be indeterminates. The objective of the following instructions is to construct lists of  $\mathbb{Q}[x]$ s g, h such that  $g_i s_{i+1} + h_i s_i = 1$  for i = 1 to i = m - 1.

#### 2.56.2 Implementation

- 1. Let  $g = h = \langle \rangle$ .
- 2. If m > 2, do the following:
  - (a) Verify that  $q_{m-1}s_{m-1} s_m = s_{m-2}$ .
  - (b) Execute procedure 56 on  $s_{[0:m]}$  and  $q_{[1:m-1]}$  and let the tuple  $\langle , , g, h \rangle$  receive.
  - (c) Verify that  $g_{m-2}s_{m-1} + h_{m-2}s_{m-2} = 1$ .
  - (d) Let  $g_{m-1} = -h_{m-2}$ .
  - (e) Let  $h_{m-1} = g_{m-2} + h_{m-2}q_{m-1}$ .
  - (f) Therefore verify that  $g_{m-1}s_m + h_{m-1}s_{m-1} = g_{m-2}s_{m-1} + h_{m-2}(q_{m-1}s_{m-1} s_m) = g_{m-2}s_{m-1} + h_{m-2}s_{m-2} = 1.$
- 3. Otherwise, if m=2 do the following:
  - (a) Verify that  $s_0 + s_2 = q_1 s_1$ .
  - (b) Let  $g_1 = -\frac{1}{s_0}$ .
  - (c) Let  $h_1 = \frac{q_1}{s_0}$ .
  - (d) Therefore verify that  $g_1s_2 + h_1s_1 = 1$ .
- 4. Yield the tuple  $\langle s, q, g, h \rangle$ .

Let us use the notation  $J_s(x)$  as a shorthand for "the number of sign changes in the list  $s_0(x), s_1(x), \dots, s_{|s|-1}(x)$ ".

## 2.57 Procedure 57 (Change in number of sign changes verification)

#### 2.57.1 Objective

Execute procedure 56 and let  $\langle s,q,g,h \rangle$  receive. Execute procedure 52 on s and let  $\langle G \rangle$  receive the result. Choose  $\mathbb{Q}$ s c and d in such a way that:

- 1.  $J_m(c)$  and  $J_m(d)$  are well defined.
- 2. Letting  $B = \max_{i=1}^m |G_i(c,d)|$ .
- 3. Letting  $C = \max_{i=1}^{m-1} \max(|g_i(c)|, |h_i(c)|, |g_i(d)|, |h_i(d)|)|$ .

- 4. Letting  $D = \max_{i=1}^{m-1} \max(|q_i(c)|, |q_i(d)|, 2)$ .
- 5.  $|d-c| \leq \frac{1}{BCD}$ .

The objective of the following instructions is to show that either 0 < 0 or  $|J_m(d) - J_m(c)| = [\operatorname{sgn}(s_m(c)) \neq \operatorname{sgn}(s_m(d))].$ 

#### 2.57.2 Implementation

- 1. Let i = 0.
- 2. Do the following:
  - (a) Verify that  $sgn(s_i(c)) = sgn(s_i(d))$ .
  - (b) Verify that  $J_i(c) = J_i(d)$ .
  - (c) If  $sgn(s_{i+1}(c)) = sgn(s_{i+1}(d))$ , do the following:
    - i. Verify that  $J_{i+1}(c) = J_{i+1}(d)$ .
    - ii. Set i to i + 1 and go to (2) if the new i < m.
  - (d) Otherwise, if  $sgn(s_{i+1}(c)) \neq sgn(s_{i+1}(d))$  and  $i + 2 \leq m$ , do the following:
    - i. Execute procedure 57 auxilliary procedure on i.
    - ii. If  $sgn(s_{i+2}(c)) \neq sgn(s_{i+2}(d))$ , do the following:
      - A. Verify that  $|s_{i+2}(c)| < |s_{i+2}(d) s_{i+2}(c)| = |(d-c)G_{i+2}(c,d)| \le \frac{1}{BCD} \cdot B = \frac{1}{CD} = \frac{1}{C} \cdot \frac{1}{D} \le \frac{1}{C} (1 \frac{1}{D}).$
      - B. Using (A) and (i), verify that  $\frac{1}{C}(1 \frac{1}{D}) < |s_{i+2}(c)| < \frac{1}{C}(1 \frac{1}{D})$ .
      - C. Abort procedure.
    - iii. Otherwise if  $sgn(s_i(c)) = sgn(s_{i+2}(c))$ , do the following:
      - A. Verify that  $2\frac{1}{C}(1-\frac{1}{D}) < |s_i(c)| + |s_{i+2}(c)| = |s_i(c) + s_{i+2}(c)| = |q_{i+1}(c)s_{i+1}(c)| < D\frac{1}{CD}$ .
      - B. Verify that  $2(1 \frac{1}{D}) < 1$ .
      - C. Using (B) and the construction of D, verify that  $2 \le D < 2$ .
      - D. Abort procedure.
    - iv. Otherwise, do the following:

- A. Verify that  $\operatorname{sgn}(s_i(d)) = \operatorname{sgn}(s_i(c)) \neq \operatorname{sgn}(s_{i+2}(c)) = \operatorname{sgn}(s_{i+2}(d)).$
- B. Therefore verify that  $1 = J_{i+2}(c) J_i(c) = J_{i+2}(d) J_i(d)$ .
- C. Therefore verify that  $J_i(c) + 1 = J_{i+2}(c) = J_{i+2}(d) = J_i(d) + 1$ .
- D. Set i to i + 2 and go to (2).
- (e) Otherwise, verify the following:
  - i.  $sgn(s_{i+1}(c)) \neq sgn(s_{i+1}(d))$ .
  - ii.  $|J_{i+1}(c) J_{i+1}(d)| = 1$ .
  - iii. i + 1 = m.
- 3. If  $sgn(s_m(c)) = sgn(s_m(d))$ , then do the following:
  - (a) Verify that  $J_m(c) = J_m(d)$ .
- 4. Otherwise do the following:
  - (a) Verify that  $|J_m(d) J_m(c)| = 1$ .

### 2.57.3 Auxilliary Procedure

**Objective** Choose a non-negative integer i < m such that  $\operatorname{sgn}(s_{i+1}(c)) \neq \operatorname{sgn}(s_{i+1}(d))$  and  $i+2 \leq m$ . The objective of the following instructions is to show that  $|s_{i+1}(c)| < \frac{1}{CD}$ ,  $|s_{i+1}(d)| < \frac{1}{CD}$ ,  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i}(c)|$ ,  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i}(d)|$ ,  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i+2}(c)|$ , and  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i+2}(d)|$ .

#### Implementation

- 1. Verify the following in order:
  - (a)  $|s_{i+1}(c)| < |s_{i+1}(c) s_{i+1}(d)| = |c d||G_{i+1}(c,d)| \le |c d||B \le dB| = \frac{1}{CD}$
  - (b)  $|s_{i+1}(d)| < |s_{i+1}(c) s_{i+1}(d)| \le \frac{1}{CD}$
  - (c)  $1 = g_i(c)s_{i+1}(c) + h_i(c)s_i(c) = |g_i(c)s_{i+1}(c) + h_i(c)s_i(c)| \le |g_i(c)||s_{i+1}(c)| + |h_i(c)||s_i(c)| < C(\frac{1}{CD} + |s_i(c)|)$
  - (d)  $\frac{1}{C}(1-\frac{1}{D}) < |s_i(c)|$
  - (e)  $1 < C(\frac{1}{CD} + |s_i(d)|)$
  - (f)  $\frac{1}{C}(1 \frac{1}{D}) < |s_i(d)|$

- (g)  $1 = g_{i+1}(c)s_{i+2}(c) + h_{i+1}(c)s_{i+1}(c) = |g_{i+1}(c)s_{i+2}(c) + h_{i+1}(c)s_{i+1}(c)| \le |g_{i+1}(c)||s_{i+2}(c)| + |h_{i+1}(c)||s_{i+1}(c)| < C(|s_{i+2}(c)| + \frac{1}{CD})$
- (h)  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i+2}(c)|$
- (i)  $1 < C(|s_{i+2}(d)| + \frac{1}{CD})$
- (j)  $\frac{1}{C}(1-\frac{1}{D}) < |s_{i+2}(d)|$

## 2.58 Procedure 58 (Cauchy's positive verification)

### 2.58.1 Objective

Choose a  $\mathbb{Q}[x]$   $p = p_0 x^t + p_1 x^{t-1} + p_2 x^{t-2} + \dots + p_t x^0$ , where  $p_0 \neq 0$ . Choose a  $\mathbb{Q}[k]$   $k > 1 + \max_{i=1}^t \left| \frac{p_i}{p_0} \right|$ . The objective of the following instructions is to show that  $\operatorname{sgn}(p(k)) = \operatorname{sgn}(p_0)$ .

### 2.58.2 Implementation

- 1. In reverse order verify the following:
  - (a)  $\operatorname{sgn}(p_0 k^n + p_1 k^{n-1} + \dots + p_n k^0) = \operatorname{sgn}(p_0)$
  - (b)  $\operatorname{sgn}(k^n + \frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0) = 1$
  - (c)  $k^n + \frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0 > 0$
  - (d)  $k^n > -(\frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0)$
  - (e)  $k^n > |\frac{p_1}{p_0}k^{n-1} + \dots + \frac{p_n}{p_0}k^0|$
  - (f)  $k^n > |\max_{i=1}^t |\frac{p_i}{p_0}|(k^{n-1} + \dots + k^0)|$
  - (g)  $k^n > \max_{i=1}^t \left| \frac{p_i}{p_0} \right| \frac{k^n 1}{k 1}$
  - (h)  $k^{n+1} k^n > \max_{i=1}^t \left| \frac{p_i}{p_0} \right| (k^n 1)$
  - (i)  $k^{n+1} (1 + \max_{i=1}^{t} |\frac{p_i}{p_0}|) k^n + \max_{i=1}^{t} |\frac{p_i}{p_0}| > 0$
  - (j)  $k > 1 + \max_{i=1}^{t} \left| \frac{p_i}{p_0} \right|$

## 2.59 Procedure 59 (Cauchy's alternation verification)

#### 2.59.1 Objective

Choose a  $\mathbb{Q}[x]$   $p = p_0 x^t + p_1 x^{t-1} + p_2 x^{t-2} + \dots + p_t x^0$ , where  $p_0 \neq 0$ . Choose a  $\mathbb{Q}$   $k < -(1 + \max_{i=1}^t |\frac{p_i}{p_0}|)$ . The objective of the following instructions is to show that  $\operatorname{sgn}(p(k)) = (-1)^t \operatorname{sgn}(p_0)$ .

#### 2.59.2 Implementation

- 1. Let  $q = q_0 x^t + q_1 x^{t-1} + q_2 x^{t-2} + \dots + q_t x^0$ , where  $q_i = (-1)^i p_i$ .
- 2. Verify that  $k < -(1 + \max_{i=1}^{t} |\frac{q_i}{q_0}|)$ .
- 3. Therefore verify that  $-k > 1 + \max_{i=1}^t \left| \frac{q_i}{q_0} \right|$ .
- 4. Execute procedure 58 on q and -k.
- 5. Hence verify that  $(-1)^t \operatorname{sgn}(p(k))$ 
  - (a) =  $\operatorname{sgn}((-1)^t p(k))$
  - (b) =  $\operatorname{sgn}((-1)^t \sum_{i=0}^t p_i k^{t-i})$
  - (c) =  $\operatorname{sgn}(\sum_{i=0}^{t} (-1)^{i} (-1)^{t-i} p_i k^{t-i})$
  - (d) =  $\operatorname{sgn}(\sum_{i=0}^{t} q_i(-k)^{t-i})$
  - (e) =  $\operatorname{sgn}(q(-k))$
  - (f) =  $\operatorname{sgn}(q_0)$
  - $(g) = \operatorname{sgn}(p_0).$
- 6. Therefore verify that  $\operatorname{sgn}(p(k)) = (-1)^t (-1)^t \operatorname{sgn}(p(k)) = (-1)^t \operatorname{sgn}(p_0)$ .

## 2.60 Procedure 60 (Range subdivision)

#### 2.60.1 Objective

Choose a list of  $\mathbb{Q}[x]$ s, s, and  $\mathbb{Q}$ s a, l, c such that a < c and l > 0. The objective of the following instructions is to either show that 0 < 0 or to construct a list of  $\mathbb{Q}$ s, b, such that  $a = b_1 < b_2 < \cdots < b_{|b|} = c$ ,  $b_{i+1} - b_i \le l$  for i = 1 to i = |b| - 1, and  $J_s(b)$  is defined for i = 1 to i = |b| - 1.

## 2.60.2 Implementation

- 1. Let  $e = \langle \langle \rangle, \langle \rangle, \cdots, \langle \rangle \rangle$ .
- 2. Let  $f = \sum_{r=1}^{|s|} \deg(s_r)$ .
- 3. Let  $b = \langle a \rangle$ .
- 4. Let  $d = b_1$ .
- 5. While d + l < c, do the following:
  - (a) Let m = l.
  - (b) While  $J_s(d+m)$  is not defined and  $|e| \leq f$ , do the following:

- $s_i(d+m) = 0.$
- ii. Append d + m onto  $e_i$ .
- iii. Set  $m=\frac{m}{2}$
- (c) If  $\sum |e| > f$ , then do the following:
  - i. If  $|e_i| \leq \deg(s_i)$  for  $1 \leq i \leq |s|$ , then do the following:
    - A. Verify that  $\sum |e| \leq f$ .
    - B. Therefore using (c), verify that  $\sum |e| \le f < \sum |e|$ .
    - C. Abort procedure.
  - ii. Otherwise, do the following:
    - A. Let  $1 \leq i \leq |s|$  be an integer such that  $|e_i| > \deg(s_i)$ .
    - B. Execute procedure 53 on  $s_i$  and a sorted  $e_i$ .
    - C. Abort procedure.
- (d) Otherwise, do the following:
  - i. Verify that  $J_s(d+m)$  is defined.
  - ii. Append d + m onto b.
  - iii. Verify that  $0 < b_{|b|} b_{|b|-1} = m \le l$ .
  - iv. Set d to d+m.
  - v. Using (5), verify that d < c.
- 6. Verify that d < c.
- 7. Verify that  $d + l \ge c$ .
- 8. Therefore verify that  $0 < c d \le l$ .
- 9. Append c onto b.
- 10. Yield  $\langle b \rangle$ .

#### **Procedure** 2.6161 (Sturm's sign change)

#### 2.61.1Objective

Execute procedure 56 and let  $\langle s, q, g, h \rangle$  receive. Let m = |s| - 1. The objective of the following instructions is to either show that 0 < 0 or to construct two lists of rational numbers c, d such that

i. Let  $1 \le i \le |s|$  be an integer such that  $c_1 < d_1 \le c_2 < d_2 \le \cdots \le c_m < d_m$  and  $\operatorname{sgn}(s_m(c_i)) = -\operatorname{sgn}(s_m(d_i))$  for i = 1 to i = m.

#### 2.61.2 Implementation

- 1. Let  $U = 1 + \max_{i=0}^{m} \left( 1 + \max_{j=1}^{i} \left| \frac{x^{i-j} \circ s_i}{x^i \circ s_i} \right| \right)$
- 2. Using procedure 58, verify that J(U) = 0.
- 3. Using procedure 59, verify that J(-U) = m.
- 4. Execute procedure 52 on s and let  $\langle G \rangle$  receive the result.
- 5. Let the rational  $B = \max_{i=1}^{m} |G_i|(U, U)$ .
- 6. Let  $C = \max_{i=1}^{m} \max(|g_i|(U), |h_i|(U))$ .
- 7. Let  $D = \max(3, \max_{i=1}^{m} |q_i|(U))$
- 8. Let  $l = \frac{1}{BCD}$ .
- 9. Execute procedure 60 on s with endpoints -U, Uand a step size of l and let  $\langle e \rangle$  receive the result.
- 10. Let  $c = d = \langle \rangle$ .
- 11. For i = 1 to i = |e| 1:
  - (a) Execute procedure 57 on the tuple  $\langle e_i, e_{i+1} \rangle$ .
  - (b) If  $J_m(c) \neq J_m(d)$ , then do the following:
    - i. Append  $e_i$  to c.
    - ii. Append  $e_{i+1}$  to d.
    - iii. Cognizant of procedure 57, verify that  $|J_m(d) - J_m(c)| = 1.$
    - iv. Therefore verify that  $sgn(s_m(c_{|c|})) =$  $-\operatorname{sgn}(s_m(d_{|d|})).$
    - v. Also verify that  $d_{|d|-1} \leq c_{|c|} < d_{|d|}$ .
- 12. If less than m pairs of rational numbers were recorded, then do the following:
  - (a) Verify that each change of  $J_m(x)$  over the course of (12) was by 1.
  - (b) Verify that  $J_m(x)$  changed less than m times over the course of (12).
  - (c) Therefore verify that  $|J_m(U) J_m(-U)| <$
  - (d) Therefore using (2) and (3), verify that m = $|J_m(U) - J_m(-U)| < m.$
  - (e) Abort procedure.

- 13. Otherwise, do the following:
  - (a) Verify that  $m \leq |c| = |d|$ .
  - (b) Yield the tuple  $\langle \langle c_1, d_1 \rangle, \langle c_2, d_2 \rangle, \cdots, \langle c_m, d_m \rangle \rangle$ .

### 2.62 Procedure 62

#### 2.62.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to define the  $\mathcal{M}_{m^2,*}(\mathbb{Q})$  pows(A).

#### 2.62.2 Implementation

- 1. Let  $t = \deg(\operatorname{last}_A)$ .
- 2. Make an  $m^2 \times t$  matrix, pows(A), whose  $i^{th}$  column is the sequential concatenation of the columns of  $A^{t-i}$ .
- 3. Yield  $\langle pows(A) \rangle$ .

#### 2.63 Procedure 63

#### 2.63.1 Objective

Choose an  $\mathcal{M}_{m,n}(\mathbb{Q})$ , A, and an  $\mathcal{M}_{n,m}(\mathbb{Q})$ , B, such that  $AB = I_m$ . The objective of the following instructions is to show that either 0 = 1 or every column of B is non-zero.

#### 2.63.2 Implementation

- 1. If any column i of B,  $Be_i$ , is equal to zero, then:
  - (a) Verify that  $0_{n\times 1} = A0_{n\times 1} = A(Be_i) = (AB)e_i = I_m e_i = e_i$ .
  - (b) Therefore verify that 0=1.
  - (c) Abort procedure.

## 2.64 Procedure 64

#### 2.64.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Choose a  $\mathbb{Q}[x]$  p such that  $p \neq 0$ , p(A) = 0, and  $\deg(p) < \deg(\operatorname{last}_A)$ . The

objective of the following instructions is to show that 0 < 0.

#### 2.64.2 Implementation

- 1. Execute procedure 51 on A and p and let f receive
- 2. Now verify that  $p = f \operatorname{last}_A$ .
- 3. Verify that  $f \neq 0$  and  $last_A \neq 0$ .
- 4. Therefore verify that  $deg(last_A) > deg(p) = deg(f last_A) \ge deg(last_A)$ .
- 5. Abort procedure.

#### 2.65 Procedure 65

#### 2.65.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 21 on pows(A) and let the tuple  $\langle M, D, N \rangle$  receive the result. Let  $t = \operatorname{cols}(\operatorname{pows}(A))$ . The objective of the following instructions is to show that either 0 < 0 or to show that  $C_t(D) = C_t(D)_{1,1}e_1 \neq 0$ .

### 2.65.2 Implementation

- 1. Execute procedure 21 on pows(A) and let the tuple  $\langle M, D, , N \rangle$  receive the result.
- 2. Verify that  $M_* pows(A)N_* = D$ .
- 3. Using procedure 6, verify that  $M^{-1}MFN = I_{m^2}FN = FN = M^{-1}D$ .
- 4. If  $C_t(D)_{1,1} = 0$ , then:
  - (a) Verify that for some  $1 \le i \le t$ ,  $D_{i,i} = 0$ .
  - (b) Therefore verify that  $De_i = 0_{m^2 \times 1}$ .
  - (c) Therefore verify that  $F(Ne_i) = (FN)e_i = (M^{-1}D)e_i = M^{-1}(De_i) = 0_{m^2 \times 1}$ .
  - (d) Let  $p = N_{1,i}x^{t-1} + N_{2,i}x^{t-2} + \dots + N_{t,i}x^0$ .
  - (e) Therefore verify that  $p(A) = 0_{m \times m}$
  - (f) Execute procedure 63 on  $N^{-1}_*$  and  $N_*$ .
  - (g) Therefore verify that  $p \neq 0$ .
  - (h) Execute procedure 64 on A and p.
  - (i) Abort procedure.

#### 5. Otherwise, do the following:

- (a) Execute procedure 19 on  $D, I_t, t$  and let E receive.
- (b) Verify that  $C_t(D) = C_t(DI_t) = EC_t(I_t) = E * 1 = E$ .
- (c) Verify that E is a  $\mathcal{D}_{\binom{m^2}{t},\binom{t}{t}}(\mathbb{Q}[x])$ .
- (d) Therefore verify that  $C_t(D)$  is  $\mathcal{D}_{\binom{m^2}{t},1}(\mathbb{Q}[x]).$
- (e) Therefore verify that  $C_t(D)$  $C_t(D)_{1,1}e_1 \neq 0$ .

#### 2.66 Procedure 66

#### 2.66.1 Objective

Choose a  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \operatorname{cols}(\operatorname{pows}(A))$ . The objective of the following instructions is to show that either 0 < 0 or to show that  $C_t(\operatorname{pows}(A)) \neq 0$ .

#### 2.66.2 Implementation

- 1. Execute procedure 21 on pows(A) and let the tuple  $\langle M, D, N \rangle$  receive the result.
- 2. Verify that pows(A) =  $M^{-1}*DN^{-1}*$ .
- 3. Execute procedure 63 on  $C_t(M_*)$ ,  $C_t(M^{-1}_*)$ .
- 4. Verify that all columns of  $C_t(M^{-1})$  are non-zero.
- 5. Let  $t = \operatorname{cols}(\operatorname{pows}(A))$ .
- 6. Execute procedure 65 on A.
- 7. Verify that  $C_t(D) = C_t(D)_{1,1}e_1 \neq 0$ .
- 8. Therefore verify that  $C_t(D)_{1,1} \neq 0$ .
- 9. Execute procedure 63 on  $C_t(N_*)$ ,  $C_t(N^{-1}_*)$ .
- 10. Verify that  $C_t(N^{-1}) \neq 0$ .
- 11. Verify that  $C_t(\text{pows}(A)) = C_t(M^{-1}DN^{-1}) = C_t(M^{-1})C_t(D)C_t(N^{-1}) = C_t(M^{-1})C_t(D)_{1,1}e_1C_t(N^{-1}) = C_t(D)_{1,1}C_t(N^{-1})C_t(M^{-1})e_1 \neq 0_{\binom{m^2}{t} \times 1}.$

Let  $\operatorname{mat}_t(p)$  be a shorthand for " $(x^{t-1} \circ p)e_1 + (x^{t-2} \circ p)e_2 + \cdots + (x^0 \circ p)e_t$ " in what follows.

Let pol(P) be a shorthand for " $P_{1,1}x^{t-1} + P_{2,1}x^{t-2} + \cdots + P_{t,1}$  where t = rows(P)" in what follows.

#### 2.67 Procedure 67

### 2.67.1 Objective

Choose an  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to define the  $\mathbb{Q}[x]$  sel<sub>A</sub>.

#### 2.67.2 Implementation

- 1. Using procedure 27 and procedure 66, verify that  $C_t(\operatorname{pows}(A)^T \operatorname{pows}(A)) = C_t(\operatorname{pows}(A)^T)C_t(\operatorname{pows}(A)) = C_t(\operatorname{pows}(A))^TC_t(\operatorname{pows}(A)) = \|C_t(\operatorname{pows}(A))\|^2 > 0.$
- 2. Let  $H = (pows(A)^T pows(A)) \setminus e_1$ .
- 3. Let  $t = \deg(\operatorname{last}_A)$ .
- 4. Let  $\operatorname{sel}_A = \frac{\operatorname{pol}(H)}{r^t \operatorname{olast}_A}$ .
- 5. Yield  $\langle \operatorname{sel}_A \rangle$ .

Let us use the notation tr(X) as a shorthand for "the sum of the diagonal entries of the square matrix X" in what follows.

### 2.68 Procedure 68

#### 2.68.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \deg(\operatorname{last}_A)$ . Choose two  $\mathbb{Q}[x]$ s  $u = u_1x^{t-1} + u_2x^{t-2} + \cdots + u_tx^0$ ,  $w = w_1x^{t-1} + w_2x^{t-2} + \cdots + w_tx^0$ . The objective of the following instructions is to show that  $\operatorname{tr}(u(A)w(A)) = \operatorname{mat}(u)^T \operatorname{pows}(A)^T \operatorname{pows}(A) \operatorname{mat}_t(w)$ .

#### 2.68.2 Implementation

- 1. Verify that tr(u(A)w(A))
  - (a) = tr( $(\sum_{p=1}^{t} u_p A^{t-p})(\sum_{q=1}^{t} w_q A^{t-q})$ )
  - (b) =  $\operatorname{tr}(\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q A^{t-p} A^{t-q})$
  - (c) =  $\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q \operatorname{tr}(A^{t-p} A^{t-q})$
  - (d) =  $\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q \sum_{e=1}^{m} \sum_{f=1}^{m} A^{t-p}_{e,f} A^{t-q}_{f,e}$
  - (e) =  $\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q \sum_{e=1}^{m} \sum_{f=1}^{m} A^{t-p}_{f,e} A^{t-q}_{f,e}$
  - (f) =  $\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q \sum_{g=1}^{m^2} \text{pows}(A)_{g,p} \text{pows}(A)_{g,q}$

- (g) =  $\sum_{p=1}^{t} \sum_{q=1}^{t} u_p w_q (\text{pows}(A)^T \text{pows}(A))_{p,q}$
- (h) =  $\sum_{p=1}^{t} u_p(\text{pows}(A)^T \text{pows}(A) \text{mat}_t(w))_p$
- (i) =  $\operatorname{mat}_t(u)^T \operatorname{pows}(A)^T \operatorname{pows}(A) \operatorname{mat}_t(w)$

#### 2.69 Procedure 69

### 2.69.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \deg(\operatorname{last}_A)$ . Choose a  $\mathbb{Q}[x]$  u such that  $\deg(u) < t$ . The objective of the following instructions is to show that  $\operatorname{tr}(u(A)\operatorname{sel}_A(A)) = \frac{x^{t-1}\circ u}{x^t \circ \operatorname{last}_A}$ .

#### 2.69.2 Implementation

- 1. Using procedure 68 and procedure 67, verify that  $\operatorname{tr}(u(A)\operatorname{sel}_A(A))$ 
  - (a) =  $\operatorname{mat}(u)^T \operatorname{pows}(A)^T \operatorname{pows}(A) \operatorname{mat}_t(\operatorname{sel}_A)$
  - (b) =  $\frac{\max(u)^T \operatorname{pows}(A)^T \operatorname{pows}(A)((\operatorname{pows}(A)^T \operatorname{pows}(A))) \setminus e_1)}{x^t \operatorname{olast}_A}$
  - (c) =  $\frac{\operatorname{mat}(u)^T e_1}{x^t \operatorname{olast}_A}$
  - (d) =  $\frac{\max(u)_{1,1}}{x^t \circ \operatorname{last}_A}$
  - (e) =  $\frac{x^{t-1} \circ u}{x^t \circ \operatorname{last}_A}$

#### 2.70 Procedure 70

#### 2.70.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to either show that  $0 \neq 0$  or construct  $\mathbb{Q}[x]$ s u, v such that  $u \operatorname{last}_A + v \operatorname{sel}_A = 1$ .

#### 2.70.2 Implementation

- 1. Let  $t = \deg(\operatorname{last}_A)$ .
- 2. Let G be a  $\mathcal{M}_{1,2}(\mathbb{Q}[x])$  where  $G_{1,1} = \text{last}_A$  and  $G_{1,2} = \text{sel}_A$ .
- 3. Execute procedure 21 on G and let the tuple  $\langle M, D, N \rangle$  receive.
- 4. Verify that  $G = M^{-1} DN^{-1}$ .
- 5. Verify that  $last_A \neq 0$ .

- 6. Therefore verify that  $D_{1,1} \neq 0$ .
- 7. If  $deg(D_{1,1}) > 0$ , then do the following:
  - (a) Let  $b = N^{-1}_{*1,1}$ .
  - (b) Verify that  $last_A = bD_{1,1}$ .
  - (c) Let  $z = \deg(b)$ .
  - (d) Verify that  $t = \deg(\text{last}_A) = \deg(bD_{1,1}) = \deg(b) + \deg(D_{1,1}) > \deg(b) = z$ .
  - (e) Let  $c = N^{-1}_{*1,2}$ .
  - (f) Verify that  $sel_A = cD_{1,1}$ .
  - (g) Let  $u = x^{t-z-1}b$ .
  - (h) Execute procedure 69 on A and u.
  - (i) Hence verify that  $\operatorname{tr}(u(A)\operatorname{sel}_A(A)) = x^{t-1} \circ u = x^z \circ b \neq 0$ .
  - $\begin{array}{lll} \text{(j) Also verify that } & \mathrm{tr}(u(A) \, \mathrm{sel}_A(A)) & = \\ & \mathrm{tr}(A^{z-1}b(A)c(A)D_{1,1}(A)) & = \\ & \mathrm{tr}(A^{z-1}c(A)b(A)D_{1,1}(A)) & = \\ & \mathrm{tr}(A^{z-1}c(A) \, \mathrm{last}_A(A)) & = \\ & \mathrm{tr}(A^{z-1}c(A)0_{m \times m}) = \mathrm{tr}(0_{m \times m}) = 0. \end{array}$
  - (k) Therefore verify that  $0 \neq 0$ .
  - (l) Abort procedure.
- 8. Otherwise, do the following:
  - (a) Verify that  $deg(D_{1,1}) = 0$ .
  - (b) Let  $u = \frac{N_{1,1}}{D_{1,1}}$ .
  - (c) Let  $v = \frac{N_{2,1}}{D_{1,1}}$ .
  - (d) Verify that  $u \operatorname{last}_A + v \operatorname{sel}_A = 1$ .
  - (e) Yield the tuple  $\langle u, v \rangle$ .

## 2.71 Procedure 71 (Euclidean division)

#### 2.71.1 Objective

Choose two  $\mathbb{Q}[x]$ s,  $\langle a, b \rangle$ . The objective of the following instructions is to construct two  $\mathbb{Q}[x]$ s u, w such that a = ub + w and  $\deg(w) < \deg(b)$ .

#### 2.71.2 Implementation

- 1. If  $deg(a) \ge deg(b)$ :
  - (a) Let  $y = \frac{x^{\deg(a)} \circ a}{x^{\deg(b)} \circ b} x^{\deg(a) \deg(b)}$
  - (b) Let e = a yb.
  - (c) Verify that deg(e) < deg(a).
  - (d) Execute procedure 71 on the tuple  $\langle e, b \rangle$ . Let the tuple  $\langle c, d \rangle$  receive the result.
  - (e) Verify that cb + d = e.
  - (f) Verify that deg(d) < deg(b).
  - (g) Therefore verify that cb + d = a yb
  - (h) Therefore verify that (y+c)b+d=a.
  - (i) Also verify that deg(d) < deg(b).
  - (j) Now yield the tuple  $\langle y+c,d\rangle$ .
- 2. Otherwise:
  - (a) Verify that 0\*b+a=a.
  - (b) Verify that deg(a) < deg(b).
  - (c) Yield the tuple (0, a).

#### 2.72 Procedure 72

#### 2.72.1 Objective

Choose two lists of  $\mathbb{Q}[x]$ s s,q and a non-negative integer k in such a way that, letting m = |s| - 1,

- 1. k < m.
- 2. For  $k \leq i \leq m$ ,  $\deg(s_i) = i$ .
- 3. For k < i < m,  $s_{i-1} + s_{i+1} = q_i s_i$ .

Let deg(0) = -1. The objective of the following instructions is to construct  $\mathbb{Q}[x]s$  g, h such that  $s_k = gs_{m-1} + hs_m$ , deg(g) = m - 1 - k, and deg(h) = m - 2 - k.

#### 2.72.2 Implementation

- 1. If k < m 2, do the following:
  - (a) Verify that  $s_k + s_{k+2} = q_{k+1}s_{k+1}$ .
  - (b) Therefore verify that  $s_k = q_{k+1}s_{k+1} s_{k+2}$ .

- (c) Execute procedure 72 on s, q, k + 1 and let the tuple  $\langle g_1, h_1 \rangle$  receive.
- (d) Verify that  $s_{k+1} = g_1 s_{m-1} + h_1 s_m$ .
- (e) Verify that  $deg(g_1) = m 1 (k + 1) = m k 2$ .
- (f) Verify that  $deg(h_1) = m 2 (k + 1) = m k 3$ .
- (g) Execute procedure 72 on s, q, k + 2 and let the tuple  $\langle g_2, h_2 \rangle$  receive.
- (h) Verify that  $s_{k+2} = g_2 s_{m-1} + h_2 s_m$ .
- (i) Verify that  $deg(g_2) = m 1 (k + 2) = m k 3$ .
- (j) Verify that  $deg(h_2) = m 2 (k + 2) = m k 4$ .
- (k) Let  $g = q_{k+1}g_1 g_2$ .
- (l) Verify that deg(g) = max(1 + (m k 2), m k 3) = m 1 k.
- (m) Let  $h = q_{k+1}h_1 h_2$ .
- (n) Verify that deg(h) = max(1 + (m k 3), m k 4) = m 2 k.
- (o) Verify that  $s_k = q_{k+1}(g_1s_{m-1} + h_1s_m) (g_2s_{m-1} + h_2s_m) = (q_{k+1}g_1 g_2)s_{m-1} + (q_{k+1}h_1 h_2)s_m = gs_{m-1} + hs_m.$
- 2. Otherwise, if k = m 2 do the following:
  - (a) Verify that  $s_{m-2} + s_m = q_{m-1}s_{m-1}$ .
  - (b) Let  $g = q_{m-1}$ .
  - (c) **Verify that** deg(g) = 1 = m 1 k.
  - (d) Let h = -1.
  - (e) **Verify that** deg(h) = 0 = m 2 k.
  - (f) Therefore verify that  $s_k = s_{m-2} = q_{m-1}s_{m-1} s_m = gs_{m-1} + hs_m$ .
- 3. Otherwise, if k = m 1 do the following:
  - (a) Let g = 1.
  - (b) **Verify that**  $\deg(g) = 0 = m 1 k$ .
  - (c) Let h = 0.
  - (d) Verify that deg(h) = -1 = m 2 k.
  - (e) Verify that  $s_k = s_{m-1} = gs_{m-1} + hs_m$ .
- 4. Yield the tuple  $\langle q, h \rangle$ .

## 2.73 Procedure 73 (Edwards' Sturm chain construction)

#### 2.73.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \deg(\operatorname{last}_A)$ . The objective of the following instructions is to construct lists of  $\mathbb{Q}[x]$ s s, q such that

- 1. For i = 0 to i = t,  $\deg(s_i) = i$ .
- 2. For i = 0 to i = t,  $\operatorname{sgn}(x^i \circ s_i) = \operatorname{sgn}(x^t \circ s_t)$ .
- 3. For i = 1 to i = t 1,  $s_{i-1} + s_{i+1} = q_i s_i$ .
- 4.  $s_t = last_A$ .

#### 2.73.2 Implementation

- 1. Execute procedure 70 on A and let  $\langle u, s_{t+1} \rangle$  receive the result.
- 2. Verify that  $us_t + s_{t+1} \operatorname{sel}_A = 1$ .
- 3. Execute procedure 71 on the tuple  $\langle s_{t+1}, s_t \rangle$ . Let the tuple  $\langle q_t, s_{t-1} \rangle$  receive the result.
- 4. Verify that  $s_{t+1} = q_t s_t + s_{t-1}$ , where  $\deg(s_{t-1}) < \deg(s_t) = t$ .
- 5. Therefore verify that  $us_t + (q_t s_t + s_{t-1}) \operatorname{sel}_A = 1$ .
- 6. Therefore verify that  $s_{t-1}(A)\operatorname{sel}_A(A) = u(A)s_t(A) + (q_t(A)s_t(A) + s_{t-1}(A))\operatorname{sel}_A(A) = I_{m,m}$ .
- 7. Therefore using procedure 69, verify that  $\frac{x^{t-1} \circ s_{t-1}}{x^t \circ s_t} = \operatorname{tr}(s_{t-1}(A) \operatorname{sel}_A(A)) = \operatorname{tr}(I_{m,m}) = m > 0.$
- 8. For i = t 1 down to i = 1, do the following:
  - (a) Execute procedure 71 on the tuple  $\langle -s_{i+1}, -s_i \rangle$ . Let the tuple  $\langle q_i, s_{i-1} \rangle$  receive the result.
  - (b) Verify that  $deg(q_i) = 1$ .
  - (c) Verify that  $x \circ q_i = \frac{x^{i+1} \circ s_{i+1}}{x^i \circ s_i}$ .
  - (d) Also verify that  $-s_{i+1} = -q_i s_i + s_{i-1}$ .
  - (e) Therefore verify that  $q_i s_i = s_{i+1} + s_{i-1}$ .
  - (f) Therefore verify that  $q_i s_i s_{i+1} = s_{i-1}$ .
  - (g) Execute procedure 72 on the tuple  $\langle s, q, i-1 \rangle$  and let  $\langle p, j \rangle$  receive.
  - (h) Verify that  $s_{i-1} = ps_{t-1} + q_3s_t$ .

- (i) Verify that deg(p) = t 1 (i 1) = t i.
- (j) Verify that  $deg(q_3) = t 2 (i 1) = t 1 i$
- (k) Therefore verify that  $s_{i-1}(A) = p(A)s_{t-1}(A) + j(A)s_t(A) = p(A)s_{t-1}(A) + j(A)0_{m \times m} = p(A)s_{t-1}(A).$
- (1) If p(A) = 0, then do the following:
  - i. Execute procedure 64 on A and p.
  - ii. Abort procedure.
- (m) Otherwise, if  $s_{i-1}(A) = 0_{m \times m}$ , then do the following:
  - i. Verify that  $p(A)s_{t-1}(A)\operatorname{sel}_A(A) = s_{i-1}(A)\operatorname{sel}_A(A) = 0_{m \times m}\operatorname{sel}_A(A) = 0_{m \times m}.$
  - ii. Verify that  $p(A)s_{t-1}(A)\operatorname{sel}_A(A) = p(A)I_{m,m} = p(A) \neq 0_{m \times m}$ .
  - iii. Therefore verify that  $0 \neq 0$ .
  - iv. Abort procedure.
- (n) Otherwise if  $s_{i-1}(A) \operatorname{sel}_A(A) = 0_{m \times m}$ , then do the following:
  - i. Verify that  $s_{i-1}(A)\operatorname{sel}_A(A)s_{t-1}(A) = 0_{m \times m}s_{t-1}(A) = 0_{m \times m}$ .
  - ii. Verify that  $s_{i-1}(A) \operatorname{sel}_A(A) s_{t-1}(A) = s_{i-1}(A) I_{m,m} = s_{i-1}(A) \neq 0.$
  - iii. Therefore verify that  $0 \neq 0$ .
  - iv. Abort procedure.
- (o) Otherwise, do the following:
  - i. Verify that  $\deg(s_{i-1}) < i$ .
  - ii. Verify that  $s_{i-1}(A) \operatorname{sel}_A(A) \neq 0_{m \times m}$ .
  - iii. Execute the auxilliary procedure on the tuple  $(i-1, s_{i-1})$ .
  - iv. Hence verify that  $\frac{x^{i-1} \circ s_{i-1}}{x^i \circ s_i} = \operatorname{tr}(s_{i-1}(A)^2 \operatorname{sel}_A(A)^2) = \operatorname{tr}((s_{i-1}(A) \operatorname{sel}_A(A))^2) = \|s_{i-1}(A) \operatorname{sel}_A(A)\|^2 > 0.$
  - v. Therefore verify that  $sgn(x^{i-1} \circ s_{i-1}) = sgn(x^i \circ s_i)$ .
- 9. Yield the tuple  $\langle s_{[0:t+1]}, q_{[0:t]} \rangle$ .

#### 2.73.3 Auxilliary procedure

**Objective** Choose an integer  $0 \le k \le t$  such that polynomial  $s_k$  is defined. Choose a  $\mathbb{Q}[x]$  g such that  $\deg(g) \le \min(k, t-1)$ . The objective of the following instructions is to show that  $\operatorname{tr}(g(A)s_k(A)\operatorname{sel}_A(A)^2) = \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$ .

#### Implementation

- 1. If k = t, then verify that  $tr(g(A)s_k(A)sel_A(A)^2)$ 
  - (a) =  $\operatorname{tr}(g(A)s_t(A)\operatorname{sel}_A(A)^2)$
  - (b) =  $\operatorname{tr}(g(A)0_{m \times m} \operatorname{sel}_A(A)^2)$
  - (c) = 0
  - $(d) = \frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}.$
- 2. Otherwise if k = t 1, then verify that  $\operatorname{tr}(g(A)s_k(A)\operatorname{sel}_A(A)^2)$ 
  - (a) =  $tr(g(A)s_{t-1}(A)sel_A(A)^2)$ .
  - (b) =  $\operatorname{tr}(g(A)I_{m,m}\operatorname{sel}_A(A))$ .
  - (c) =  $\operatorname{tr}(g(A)\operatorname{sel}_A(A))$ .
  - (d)  $=\frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$ .
- 3. Otherwise if k < t 1, then do the following:
  - (a) Verify that  $deg(gq_{k+1}) = k+1 \le t-1$ .
  - (b) Execute the auxilliary procedure on the tuple  $\langle k+1, gq_{k+1} \rangle$ .
  - (c) Now verify that  $\begin{array}{ll} \operatorname{tr}((g(A)q_{k+1}(A))s_{k+1}(A)\operatorname{sel}_A(A)^2) & = \\ \frac{\frac{x^{k+2}\circ s_{k+2}}{x^{k+1}\circ s_{k+1}}x^k\circ g}{x^{k+2}\circ s_{k+2}} = \frac{x^k\circ g}{x^{k+1}\circ s_{k+1}}. \end{array}$
  - (d) Verify that  $deg(g) \le k \le t 2$ .
  - (e) Execute the auxilliary procedure on the tuple  $\langle k+2,g\rangle$ .
  - (f) Now verify that  $\operatorname{tr}(g(A)s_{k+2}(A)\operatorname{sel}_A(A)^2) = \frac{x^{k+2} \circ g}{x^{k+3} \circ s_{k+3}} = \frac{0}{x^{k+3} \circ s_{k+3}} = 0.$
  - (g) Therefore verify that  $\operatorname{tr}(g(A)s_k(A)\operatorname{sel}_A(A)^2)$

i. = 
$$\operatorname{tr}(g(A)(q_{k+1}(A)s_{k+1}(A)) + s_{k+2}(A))\operatorname{sel}_A(A)^2$$

ii. = 
$$\operatorname{tr}(g(A)q_{k+1}(A)s_{k+1}(A)\operatorname{sel}_A(A)^2) + \operatorname{tr}(g(A)s_{k+2}(A)\operatorname{sel}_A(A)^2)$$

iii. = 
$$\frac{x^k \circ g}{x^{k+1} \circ s_{k+1}} + 0$$

iv. 
$$=\frac{x^k \circ g}{x^{k+1} \circ s_{k+1}}$$
.

### 2.74 Procedure 74

#### 2.74.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \deg(\operatorname{last}_A)$ . The objective of the following instructions is to either show that 0 < 0 or to construct two lists of rational numbers c, d such that  $c_1 < d_1 \le c_2 < d_2 \le \cdots \le c_t < d_t$  and  $\operatorname{sgn}(\operatorname{last}_A(c_i)) = -\operatorname{sgn}(\operatorname{last}_A(d_i))$  for i = 1 to i = t.

### 2.74.2 Implementation

- 1. Execute procedure 73 on the matrix A and let the tuple  $\langle s, q \rangle$  receive the result.
- 2. Execute procedure 60 supplying the tuple  $\langle s, q \rangle$ . Let the tuple  $\langle c, d \rangle$  receive the result.
- 3. Verify that  $c_1 < d_1 \le c_2 < d_2 \le \cdots \le c_t < d_t$ .
- 4. Verify that  $\operatorname{sgn}(\operatorname{last}_A(c_i)) = -\operatorname{sgn}(\operatorname{last}_A(d_i))$  for i = 1 to i = t.
- 5. **Yield**  $\langle c, d \rangle$ .

### 2.75 Procedure 75

#### 2.75.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Let  $t = \deg(\operatorname{last}_A)$ . Execute procedure 74 on A and let the tuple  $\langle c, d \rangle$  receive the result. Execute procedure 21 on A and let the tuple  $\langle , u, \rangle$  receive the result. The objective of the following instructions is to either show that 1 = -1 or to construct a list of non-negative integers k such that  $\operatorname{sgn}(u_{k_i}(c_i)) = -\operatorname{sgn}(u_{k_i}(d_i))$  for i = 1 to i = t.

#### that 2.75.2 Implementation

- 1. Verify that  $last_A = u_1u_2 \cdots u_m$ .
- 2. For i = 1 to i = t do the following:

- (a) If  $\operatorname{sgn}(u_1(c_i)) = \operatorname{sgn}(u_1(d_i)), \operatorname{sgn}(u_2(c_i)) = \operatorname{sgn}(u_2(d_i)), \dots, \operatorname{sgn}(u_m(c_i)) = \operatorname{sgn}(u_m(d_i))$ , then do the following:
  - i. Verify that  $\operatorname{sgn}(u_1(c_i))\operatorname{sgn}(u_2(c_i))\cdots\operatorname{sgn}(u_m(c_i)) = \operatorname{sgn}(u_1(d_i))\operatorname{sgn}(u_2(d_i))\cdots\operatorname{sgn}(u_m(d_i)).$
  - ii. Therefore verify that  $\operatorname{sgn}(u_1(c_i)u_2(c_i)\cdots u_m(c_i)) = \operatorname{sgn}(u_1(d_i)u_2(d_i)\cdots u_m(d_i)).$
  - iii. Therefore verify that  $sgn(s_t(c_i)) = sgn(s_t(d_i))$ .
  - iv. Cognizant of the execution of procedure 60, verify that  $sgn(s_t(c_i)) = -sgn(s_t(d_i))$ .
  - v. Therefore verify that  $sgn(s_t(c_i)) = -sgn(s_t(c_i))$ .
  - vi. Therefore verify that 1 = -1.
  - vii. Abort procedure.
- (b) Otherwise do the following:
  - i. Let j be the least integer such that  $sgn(u_j(c_i)) = -sgn(u_j(d_i))$ .
  - ii. Let  $k_i = j$ .
- 3. Yield  $\langle k \rangle$ .

#### 2.76 Procedure 76

#### 2.76.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 21 on A and let the tuple  $\langle , , u, \rangle$  receive the result. Execute procedure 55 on A and let k receive. Let  $t = \deg(\operatorname{last}_A)$ . Let  $n_j = \sum_{i=1}^t [k_i = j]$ . The objective of the following instructions is to either show that 0 < 0, or to show that  $n_i = \deg(u_i)$  for i = 1 to i = m.

#### 2.76.2 Implementation

- 1. Verify that  $\sum_{j=1}^{m} n_j = \sum_{j=1}^{m} \sum_{i=1}^{t} [k_i = j] = \sum_{i=1}^{t} \sum_{j=1}^{m} [k_i = j] = \sum_{i=1}^{t} 1 = t$ .
- 2. If for any i = 1 to i = m,  $n_i > \deg(u_i)$ , then do the following:

- (a) Execute procedure 55 on the polynomial  $u_i$  along with  $\deg(u_i) + 1$  of the distinct pairs  $\langle c_l, d_l \rangle$  such that  $k_l = i$ .
- (b) Abort procedure.
- 3. Otherwise if for any i = 1 to i = m,  $n_i < \deg(u_i)$ , then do the following:
  - (a) Verify that  $\sum_{i=1}^{m} n_i < \sum_{i=1}^{m} \deg(u_i) = t$ .
  - (b) Therefore verify that  $\sum_{i=1}^{m} n_i < \sum_{i=1}^{m} n_i$ .
  - (c) Abort procedure.
- 4. Otherwise, do the following:
  - (a) For all i = 1 to i = m, verify that  $n_i = \deg(u_i)$ .

Let us use the notation "A is upper triangular" as a shorthand for "all the entries of A below the diagonal are zero" in what follows.

## 2.77 Procedure 77 (Upper triangular matrix multiplication)

#### 2.77.1 Objective

Choose two upper triangular  $\mathcal{M}_{m,m}(\mathbb{Q}[x])$ s, A and B. Let C = AB. The objective of the following instructions is to show that C is an upper triangular matrix where  $C_{i,i} = A_{i,i}B_{i,i}$  for i = 1 to i = m.

#### 2.77.2 Implementation

- 1. For i = 1 to i = m, do the following:
  - (a) Verify that  $C_{i,i} = \sum_{k=1}^{m} (A_{i,k}B_{k,i}) = \sum_{k=1}^{i-1} (A_{i,k}B_{k,i}) + A_{i,i}B_{i,i} + \sum_{k=i+1}^{m} (A_{i,k}B_{k,i}) = \sum_{k=1}^{i-1} (0 * B_{k,i}) + A_{i,i}B_{i,i} + \sum_{k=i+1}^{m} (A_{i,k} * 0) = A_{i,i}B_{i,i}.$
- 2. For i = 2 to i = m, do the following:
  - (a) For j = 1 to j = i 1, do the following:
    - i. Verify that  $C_{i,j} = \sum_{k=1}^{m} A_{i,k} B_{k,j} = \sum_{k=1}^{i-1} A_{i,k} B_{k,j} + \sum_{k=i}^{m} A_{i,k} B_{k,j} = \sum_{k=1}^{i-1} 0 * B_{k,j} + \sum_{k=i}^{m} A_{i,k} * 0 = 0.$
- 3. Therefore verify that C is upper triangular.

### 2.78 Procedure 78

#### 2.78.1 Objective

Choose integers  $m \geq n \geq 0$ . Choose a  $\mathcal{M}_{n,m}(\mathbb{Q}[x])$ , M, and a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ ,  $A_0$ , such that  $MA_0 = I_n$ . The objective of the following instructions is to either show that 1 = 0 or to define the  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ s  $A_1, A_2, \dots, A_n$ .

#### 2.78.2 Implementation

- 1. Using procedure 11, verify that  $C_n(M_0A_0) = C_n(I_n) = 1$ .
- 2. If  $C_n(A_0) = 0_{\binom{m}{n} \times 1}$ , then do the following:
  - (a) Verify that  $C_n(M_0A_0) = C_n(M_0)C_n(A_0) = C_n(M_0)0_{\binom{m}{n}\times 1} = 0.$
  - (b) Therefore verify that 1 = 0.
  - (c) Abort procedure.
- 3. Verify that  $C_n(A_0) \neq 0_{\binom{m}{n} \times 1}$ .
- 4. For i = 1 to i = n, do the following:
  - (a) If  $A_{i-1}e_i = 0_{m \times 1}$ , then do the following:
    - i. Verify that  $C_n(A_{i-1}) = 0$ .
    - ii. Cognizant of the execution of the previous iteration, verify that  $C_n(A_{i-1}) \neq 0$ .
    - iii. Therefore verify that  $0 \neq 0$ .
    - iv. Abort procedure.
  - (b) Verify that  $||A_{i-1}e_i||^2 \neq 0$ .
  - (c) Let  $D_i$  be a  $n \times n$  diagonal matrix comprising i 1s followed by  $n i ||A_{i-1}e_i||^2$ s.
  - (d) Verify that  $C_n(D_i) = (\|A_{i-1}e_i\|^2)^{n-i} \neq 0$ .
  - (e) Let  $N_i = I_n$  except that its  $i^{th}$  row is i-1 0s followed by a 1 followed by  $-(A_{i-1}{}^TA_{i-1})_{i,i+1}$ , then  $-(A_{i-1}{}^TA_{i-1})_{i,i+2}$ , all the way up to  $-(A_{i-1}{}^TA_{i-1})_{i,n}$ .
  - (f) Using procedure 11, verify that  $C_n(N_i) = 1 \neq 0$
  - (g) Let  $A_i = A_{i-1}D_iN_i$ .

- (h) Verify that  $C_n(A_i) = C_n(A_{i-1}D_iN_i) = C_n(A_{i-1})C_n(D_i)C_n(N_i) = C_n(A_{i-1})C_n(D_i) \neq 0.$
- 5. Yield the tuple  $\langle A_0, A_1, \cdots, A_n \rangle$ .

## 2.79 Procedure 79

#### 2.79.1 Objective

Choose integers  $m \geq n \geq 0$ . Choose a  $\mathcal{M}_{n,m}(\mathbb{Q}[x])$ , M, and a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ ,  $A_0$ , such that  $MA_0 = I_n$ . Execute procedure 78 on M and  $A_0$  and let the tuple  $\langle A_1, \dots, A_n \rangle$  receive the result. The objective of the following instructions is to either show that 1 = 0 or to show that  $(A_i^T A_i)_{[1:i+1],[1:i+1]}$  is a  $\mathcal{D}_{i,i}(\mathbb{Q}[x])$  for i = 1 to i = n.

#### 2.79.2 Implementation

- 1. For i = 1 to i = n, do the following:
  - (a) Let  $D_i$  be a  $n \times n$  diagonal matrix comprising i 1s followed by  $n i ||A_{i-1}e_i||^2$ s.
  - (b) Let  $N_i = I_n$  except that its  $i^{th}$  row is i-1 0s followed by a 1 followed by  $-(A_{i-1}{}^T A_{i-1})_{i,i+1}$ , then  $-(A_{i-1}{}^T A_{i-1})_{i,i+2}$ , all the way up to  $-(A_{i-1}{}^T A_{i-1})_{i,n}$ .
  - (c) Verify that  $A_i = A_{i-1}D_iN_i$ .
  - (d) Verify that  $A_i{}^T A_i = (A_{i-1}D_iN_i)^T (A_{i-1}D_iN_i) = N_i{}^T D_i{}^T (A_{i-1}{}^T A_{i-1}) D_iN_i.$
  - (e) Now verify that  $A_i^T A_i$  and  $A_{i-1}^T A_{i-1}$  are the same modulo the bottom-right  $(n-i+1) \times (n-i+1)$  block.
  - (f) Also verify that  $(A_i^T A_i)_{i,[i+1:n+1]} = 0$ .
  - (g) Also verify that  $({A_i}^T A_i)_{[i+1:n+1],i} = 0$ .
  - (h) Therefore verify that  $(A_i{}^TA_i)_{[1:i+1],[1:i+1]}$  is a  $\mathcal{D}_{i,i}(\mathbb{Q}[x])$ .

#### 2.80Procedure 80

#### 2.80.1**Objective**

Choose integers  $m \geq n \geq 0$ . Choose a  $\mathcal{M}_{n,m}(\mathbb{Q}[x])$ , M, and a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ ,  $A_0$ , such that  $MA_0 = I_n$ . Execute procedure 78 on M and  $A_0$  and let the tuple  $\langle A_1, \cdots, A_n \rangle$  receive the result. The objective of the following instructions is to either show that 1 = 0or to show that  $A_0MA_i = A_i$  and  $(e_i^TM)(A_ie_j) =$  $||A_0e_1||^2 \cdots ||A_{\min(i,j-1)-1}e_{\min(i,j-1)}||^2$  for j = 1 to j = n, for i = 1 to  $\tilde{i} = n$ .

#### 2.80.2 Implementation

- 1. For i = 1 to i = n, do the following:
  - (a) Let  $D_i$  be a  $n \times n$  diagonal matrix comprising i 1s followed by  $n-i \|A_{i-1}e_i\|^2$ s.
  - (b) Verify that  $D_i$  is upper triangular.
  - (c) Let  $N_i = I_n$  except that its  $i^{th}$ row is i-1 0s followed by a 1 followed by  $-(A_{i-1}{}^{T}A_{i-1})_{i,i+1}$ ,  $-(A_{i-1}{}^{T}A_{i-1})_{i,i+2}$ , all the way up to  $-(A_{i-1}{}^{T}A_{i-1})_{i,n}$ .
  - (d) Verify that  $N_i$  is upper triangular.
  - (e) Verify that  $A_i = A_{i-1}D_iN_i$ .
  - (f) Verify that  $A_i = A_0(D_1N_1)\cdots(D_iN_i)$ .
  - (g) Verify that  $MA_i = (D_1N_1)\cdots(D_iN_i)$ .
  - (h) Therefore verify that  $A_0MA_i = A_i$ .
  - (i) Using procedure 77, for j = 1 to j = n, verify that  $(e_i^T M)(A_i e_i)$

i. 
$$= e_j^T (MA_i)e_j$$

ii. 
$$= e_j^T((D_1N_1)\cdots(D_iN_i))e_j$$

iii. = 
$$(D_{1j,j}N_{1j,j})\cdots(D_{ij,j}N_{ij,j})$$

iv. = 
$$D_{1j,j} \cdots D_{ij,j}$$

v. = 
$$D_{1j,j} \cdots D_{\min(i,j-1)_{j,j}}$$

vi. = 
$$||A_0e_1||^2 \cdots ||A_{\min(i,j-1)-1}e_{\min(i,j-1)}||^2$$
. 5. If  $i = 0$ , then do the following:

#### 2.81 Procedure 81 (Cauchy-Schwarz inequality)

#### Objective 2.81.1

Choose a  $\mathcal{M}_{1,m}(\mathbb{Q})$ , A, and a  $\mathcal{M}_{m,1}(\mathbb{Q})$ , B. The objective of the following instructions is to show that  $(AB)^2 \leq (AA^T)(B^TB).$ 

### 2.81.2 Implementation

- 1. Verify that 0
  - (a)  $\leq \frac{1}{2} \sum_{i=1}^{m} \sum_{j=1}^{m} (A_i B_j A_j B_i)^2$
  - (b) =  $\frac{1}{2} \sum_{i=1}^{m} \sum_{j=1}^{m} (A_i^2 B_j^2 2A_i B_j A_j B_i + A_j^2 B_i^2)$
  - (c) =  $\frac{1}{2} \sum_{i=1}^{m} A_i^2 \sum_{j=1}^{m} B_j^2 + \frac{1}{2} \sum_{i=1}^{m} B_i^2 \cdot \sum_{j=1}^{m} A_j^2 \sum_{i=1}^{m} A_i B_i \sum_{j=1}^{m} A_j B_j$
  - (d) =  $\frac{1}{2}(AA^T)(B^TB) + \frac{1}{2}(AA^T)(B^TB) (AB)^2$
  - (e) =  $(AA^T)(B^TB) (AB)^2$ .
- 2. Therefore verify that  $(AB)^2 < (AA^T)(B^TB)$ .

#### 2.82 Procedure 82

#### 2.82.1 Objective

Choose integers  $m \geq n > 0$ . Choose a  $\mathcal{M}_{n,m}(\mathbb{Q}[x])$ , M, and a  $\mathcal{M}_{m,n}(\mathbb{Q}[x])$ ,  $A_0$ , such that  $MA_0 = I_n$ . Choose a  $\mathbb{Q}$ , x. Let  $a = \max(\|M(x)\|^2, 1)$ . Choose a column index  $1 \le j \le n$  such that  $||A_n(x)e_j||^2 < n$  $\frac{1}{a^{(2n+2)!!}}$ . The objective of the following instructions is to show that 1 < 1.

#### 2.82.2 Implementation

- 1. Execute procedure 78 on M and  $A_0$  and let the tuple  $\langle A_0, A_1, \cdots, A_n \rangle$  receive the result.
- 2. Let i = n.
- 3. Verify that  $||A_i(x)e_j||^2 < \frac{1}{a^{(2i+2)!!}}$ .
- 4. Using procedure verthat  $(e_j^T M(x) A_i(x) e_j)^2$  $\|e_j^T M(x)\|^2 \|A_i(x)e_j\|^2 < \|M(x)\|^2 \frac{1}{a^{(2i+2)!!}} \le$  $a \frac{1}{a^{(2i+2)!!}} \le \frac{1}{a^{(2i)!!*2i}} \le 1.$

- (a) Verify that  $(e_j{}^T M(x) A_i(x) e_j)^2$  $(e_j{}^T M(x) A_0(x) e_j)^2 = (e_j{}^T I_n e_j)^2 = 1.$
- (b) Therefore verify that 1 < 1.
- (c) Abort procedure.
- 6. Otherwise, do the following:
- 7. Using procedure 80, verify that  $(1||A_0e_1||^2 \cdots ||A_{\min(i,j-1)-1}e_{\min(i,j-1)}||^2)^2 = (e_j^T M(x)A_i(x)e_j)^2 < \frac{1}{a^{(2i)!!*2i}} \le 1.$
- 8. If  $\min(i, j 1) = 0$ , then do the following:
  - (a) Verify that  $(1||A_0(x)e_1||^2 \cdots ||A_{\min(i,j-1)-1}(x)e_{\min(i,j-1)}||^2)^2 = 1^2 = 1.$
  - (b) Therefore verify that 1 < 1.
  - (c) Abort procedure.
- 9. Otherwise do the following:
  - (a) Verify that min(i, j 1) > 0.
  - (b) If for all k = 0 to  $k = \min(i, j 1) 1$ ,  $||A_k(x)e_{k+1}||^2 \ge \frac{1}{a^{(2i)!!}}$ , then do the following:
    - i. Verify that  $(e_j^T M(x) A_i(x) e_j)^2 = (\|A_0(x) e_1\|^2 \cdots \|A_{\min(i,j-1)-1}(x) e_{\min(i,j-1)}\|^2)^2 \ge (\frac{1}{a^{(2i)!!}})^{2\min(i,j-1)} \ge (\frac{1}{a^{(2i)!!}})^{2i} = \frac{1}{a^{(2i)!!} * 2i} \cdot$
    - ii. Therefore verify that  $(e_j{}^T M(x) A_i(x) e_j)^2 < \frac{1}{a^{(2i)!!*2i}} \le (e_j{}^T M(x) A_i(x) e_j)^2.$
    - iii. Abort procedure.
  - (c) Otherwise, do the following:
    - i. Let k, where  $0 \le k < i$ , be one of the integers for which  $||A_k(x)e_{k+1}||^2 < \frac{1}{a^{(2i)!!}}$ .
    - ii. Verify that  $||A_k(x)e_{k+1}||^2 < \frac{1}{a^{(2i)!!}} \le \frac{1}{a^{(2k+2)!!}}$ .
    - iii. Simultaneously set i to k and j to k+1.
    - iv. Go to (3).

#### = 2.83 Procedure 83

#### 2.83.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Execute procedure 75 on the matrix A and let the tuple  $\langle k \rangle$  receive the result. The objective of the following instructions is to show that  $\sum_{i=1}^{t} (m+1-k_i) = m$ .

#### 2.83.2 Implementation

- 1. Execute procedure 21 on the matrix A and let the tuple  $\langle D, u, \rangle$ .
- 2. Using procedure 76, verify that  $\sum_{i=1}^{t} (m+1-k_i)$

(a) 
$$= \sum_{i=1}^{t} \sum_{i=1}^{m} [k_i \le j]$$

(b) 
$$=\sum_{j=1}^{m}\sum_{i=1}^{t}[k_i \leq j]$$

(c) = 
$$\sum_{i=1}^{m} \sum_{i=1}^{t} [k_i \le j] \sum_{l=1}^{m} [k_i = l]$$

(d) = 
$$\sum_{i=1}^{m} \sum_{l=1}^{m} \sum_{i=1}^{t} [k_i \le j] [k_i = l]$$

(e) 
$$= \sum_{i=1}^{m} \sum_{l=1}^{m} \sum_{i=1}^{t} [l \leq j] [k_i = l]$$

(f) = 
$$\sum_{i=1}^{m} \sum_{l=1}^{m} [l \le j] \sum_{i=1}^{t} [k_i = l]$$

(g) = 
$$\sum_{j=1}^{m} \sum_{l=1}^{m} [l \le j] \deg u_l$$

$$(h) = \sum_{j=1}^{m} \sum_{l=1}^{j} \deg u_l$$

$$(i) = \sum_{j=1}^{m} \deg D_{j,j}$$

$$(j) = m$$

### 2.84 Procedure 84

#### 2.84.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. The objective of the following instructions is to define the rational  $\operatorname{disc}(A)$ .

#### 2.84.2 Implementation

- 1. Execute procedure 74 on the matrix A and let the tuple  $\langle c, d \rangle$  receive the result.
- 2. Execute procedure 5 with  $xI_m A$  as the choice matrix. Let the tuple  $\langle M, D, N \rangle$  receive the result.
- 3. Let  $L = |(\|N^{-1}\|^2)^{(2m+2)!!}|$ .

- 4. Let  $\operatorname{disc}(A) = \frac{1}{\max(1, L(|c_1|), L(|d_t|))}$ .
- 5. Verify that disc(A) > 0.
- 6. Yield the tuple  $\langle \operatorname{disc}(A) \rangle$ .

Let us use the notation  $\operatorname{disc}(A)$  to refer to the invocation of procedure 84 on the matrix A.

## 2.85 Procedure 85

#### 2.85.1 Objective

Choose integers  $0 < k \le m$  and a list of  $\mathcal{T}_m(\mathbb{Q}[x])$ , N. Let  $Q = (I_m)_{*,[k:m]}$ . The objective of the following instructions is to construct an  $\mathcal{M}_{m,m+1-k}(\mathbb{Q}[x])$ , K, and an  $\mathcal{M}_{m+1-k,m+1-k}(\mathbb{Q}[x])$ , E, such that  $K_i = NQE$  and  $K^TK$  is a  $\mathcal{D}_{m+1-k,m+1-k}(\mathbb{Q}[x])$ .

#### 2.85.2 Implementation

- 1. Verify that  $(Q^T N^{-1})(NQ) = Q^T (N^{-1}N)Q = Q^T I_m Q = Q^T Q = I_{m+1-k}$ .
- 2. Execute procedure 78 on the matrices  $Q^T N^{-1}$  and NQ. Let the tuple  $\langle ,, \cdots, , K \rangle$  receive the result.
- 3. Verify that K is a  $\mathcal{M}_{m,m+1-k}(\mathbb{Q}[x])$ .
- 4. Using procedure 79, verify that  $K^TK$  is a  $\mathcal{D}_{m+1-k,m+1-k}(\mathbb{Q}[x])$ .
- 5. Let  $E = Q^T N^{-1} K$ .
- 6. Verify that E is a  $\mathcal{M}_{m+1-k,m+1-k}(\mathbb{Q}[x])$ .
- 7. Execute procedure 80 on the matrices  $Q^T N^{-1}$  and NQ.
- 8. Now verify that K = NQE.
- 9. Yield  $\langle K, E \rangle$ .

## 2.86 Procedure 86 (Symmetric matrix spectral procedure initialization)

#### 2.86.1 Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Choose a  $\mathbb{Q} \epsilon > 0$ . Execute procedure 75 on the matrix A and let the tuple  $\langle k \rangle$  receive the result. The objective of the following instructions is to either show that 1 < 1 or

to construct  $\mathbb{Q}$ s,  $0 < \delta \le 1 \le K'$ , a list of  $\mathcal{M}_{m,*}(\mathbb{Q})$ s, K, and a list of  $\mathbb{Q}$ s, g, such that for  $1 \le i \le |k|$ :

- 1.  $cols(K_i) = m + 1 k_i$ .
- 2.  $(K_i)_{p,q} \leq K'm$ , for  $1 \leq p \leq m$ , for  $1 \leq q \leq \operatorname{cols}(K_i)$ .
- 3.  $K_i^T K_i$  is a  $\mathcal{D}_{*,*}(\mathbb{Q})$ .
- 4.  $(K_i^T K_i)_{i,j} \ge \operatorname{disc}(A)$  for  $1 \le j \le \operatorname{cols}(K_i)$ .
- 5.  $|(g_iK_i AK_i)_{p,q}| < \frac{\epsilon\delta}{K'm^2}$ , for  $1 \le p \le m$ , for  $1 \le q \le \operatorname{cols}(K_i)$ .
- 6.  $\delta \leq \min_{1 \leq i \neq j \leq |q|} |g_j g_i|$ .

## 2.86.2 Implementation

- 1. Execute procedure 74 on the matrix A and let the tuple  $\langle c, d \rangle$  receive the result.
- 2. Execute procedure 21 with  $xI_m A$  as the choice matrix. Let the tuple  $\langle M, D, u, N \rangle$  receive the result.
- 3. Let M' = 1  $\max_{i=1}^{m} \max_{j=1}^{m} |M^{-1}_{*i,j}| (\max(|c_1|, |d_{|d|}|)).$
- 4. Let  $N' = 1 + \max_{i=1}^{m} \max_{j=1}^{m} |N_{*i,j}| (\max(|c_1|, |d_{|d|}|)).$
- 5. Let  $\delta = \min(1, \min_{i=1}^{|d|-1} (d_{i+1} c_i)).$
- 6. Execute procedure 85 on  $\langle k, m, N \rangle$  and let the tuple  $\langle \langle K_1, E_1 \rangle, \langle K_2, E_2 \rangle, \cdots, \langle K_{|k|}, E_{|k|} \rangle \rangle$  receive.
- 7. Using procedure 83, verify that  $\sum_{p=1}^{|k|} \operatorname{cols}(K_p) = \sum_{p=1}^{|k|} m + 1 k_p = m.$
- 8. Let  $E' = 1 + \max_{i=1}^{t} \max_{j=1}^{m+1-k_i} \max_{l=1}^{m+1-k_i} |E_{j,l}| (\max(|c_1|,|d_{|d|}|)).$
- 9. Let  $U = (1 + |u_1|)(1 + |u_2|) \cdots (1 + |u_m|)$ .
- 10. Let  $U' = U(\max(|c_1|, |d_{|d|}|))$ .
- 11. Let  $b = \frac{\epsilon \delta}{M'N'E'^2m^3}$ .
- 12. For i = 1 to i = |k|, do the following:
  - (a) Verify that  $sgn(u_{k_i}(c_i)) \neq sgn(u_{k_i}(d_i))$ .
  - (b) Execute procedure 54 on the formal polynomial  $u_{k_i}$ , interval  $(c_i, d_i)$ , and target of  $\frac{b}{U'}$ . Let  $\langle g_i \rangle$  receive the result.
  - (c) Now verify that  $|u_{k_i}(g_i)| < \frac{b}{U'}$ .
  - (d) Also verify that  $c_i \leq g_i \leq d_i$ .

- (e) For  $j = k_i$  to j = m, do the following:
  - i. Verify that  $|D_{j,j}(g_i)|$  $|u_1(g_i)||u_2(g_i)|\cdots|u_m(g_i)|$  $|u_{k_i}(g_i)||u_1|(|g_i|)\cdots|u_{k_i-1}|(|g_i|)$  $|u_{k_i+1}|(|g_i|)\cdots|u_m|(|g_i|)$  $\frac{b}{U'}U(|g_i|) = \frac{b}{U'}U' = b.$
- (f) Let  $Q = (I_m)_{*,[k_i:m]}$ .
- (g) If a diagonal entry of  $K_i(g_i)^T K_i(g_i)$  is less than disc(A), then do the following:
  - i. Let z be the column index of the diagonal entry less than  $\operatorname{disc}(A)$ .
  - ii. Verify  $\leq$
  - iii. Execute procedure 82 with matrices  $Q^T N^{-1}$  and NQ, rational number  $g_i$ , and column index z.
  - iv. Abort procedure.
- (h) Otherwise, do the following:
  - i. For j = 1 to  $j = m + 1 k_i$ , verify that  $(K_i(g_i)^T K_i(g_i))_{j,j} \ge \operatorname{disc}(A) >$
  - ii. Verify that  $xK_i AK_i = (xI_m A)K_i = M^{-1}DN^{-1}K_i = M^{-1}DN^{-1}NQE_i = M^{-1}DQE_i.$
  - iii. Verify that  $(g_i K_i(g_i) AK_i(g_i))_{p,q} = (M^{-1}(g_i)D(g_i)QE_i(g_i))_{p,q} < M'b(m+1-k_i)E' = M'\frac{\epsilon\delta}{M'N'E'^2m^3}(m+1-k_i)E' \leq \frac{\epsilon\delta}{N'E'm^2} \text{ for } 1 \leq p \leq m, \text{ for }$  $1 \le q \le m + 1 - k_i$ .
  - Verify that  $K_i(g_i)_{p,q} = (N(g_i)QE_i(g_i))_{p,q} = N'(m+1)$ iv. Verify  $k_i)E' \leq N'E'm$ .
- 13. Yield tuple  $\langle \delta, N'E', \langle K_1(g_1), \cdots, K_t(g_t) \rangle, g \rangle$ .

#### 2.87Procedure 87 (Symmetric matrix spectral)

#### 2.87.1Objective

Choose a symmetric  $\mathcal{M}_{m,m}(\mathbb{Q})$ , A. Choose a  $\mathbb{Q} \in \mathcal{A}$ 0. The objective of the following instructions is to construct an  $\mathcal{M}_{m,m}(\mathbb{Q})$ , K, and a  $\mathcal{D}_{m,m}(\mathbb{Q})$ , C, such that:

- $\leq 1. \sum_{p=1}^{m} \sum_{q=1}^{m} |(KC AK)_{p,q}| < \epsilon.$   $\leq 2. |(K^{T}K)_{i,j}| \leq 2\epsilon \text{ for } 1 \leq i \neq j < r.$ 
  - 2.  $|(K^T K)_{i,j}| \leq 2\epsilon$  for  $1 \leq i \neq j \leq m$ .
    - 3.  $(K^T K)_{i,j} \ge \operatorname{disc}(A) > 0 \text{ for } 1 \le j \le m.$

#### 2.87.2 Implementation

- 1. Execute procedure 86 on matrix A and rational  $\epsilon$ . Let the tuple  $\langle \delta, K', K, g \rangle$  receive the result.
- 2. Let C be a diagonal matrix whose  $i^{th}$ , where  $1 \le i \le t$ , group of entries are  $m+1-k_i$   $g_i$ s.
- 3. Using procedure 83, verify that C is  $m \times m$ .
- 4. Let K be a matrix whose columns are the inorder concatenation of those of  $K_1, K_2, \cdots, K_t$ .
- 5. Using procedure 83, verify that K is  $m \times m$ .
- 6. Using (1), verify that  $\sum_{p=1}^{m} \sum_{q=1}^{m} |(KC AK)_{p,q}| < \sum_{p=1}^{m} \sum_{q=1}^{m} \frac{\epsilon \delta}{K'm^2} = \frac{\epsilon \delta}{K'} \le \epsilon$ .
- 7. For i = 1 to i = m, do the following: For j = 1to j = m, do the following:
  - (a) Let a, c be such that  $Ke_i$  came from  $K_ae_c$ .
  - (b) Let b, d be such that  $Ke_j$  came from  $K_be_d$ .
  - (c) If  $a \neq b$ , then do the following:
    - i. Using (1), verify that  $|(g_b$  $g_a)(Ke_i)^T(Ke_i)$
    - ii. =  $|q_b(Ke_i)^T(Ke_i) q_a(Ke_i)^T(Ke_i)|$
    - iii. =  $|(Ke_i)^T (q_b Ke_i) (q_a Ke_i)^T (Ke_i)|$
    - iv. =  $|(Ke_i)^T (AKe_j + g_b Ke_j AKe_j) (AKe_i + g_a Ke_i AKe_i)^T (Ke_j)|$
    - v.  $\leq |(Ke_i)^T (AKe_i) (AKe_i)^T (Ke_i)| +$  $|(Ke_i)^T(g_bKe_j - AKe_j)| + |(g_aKe_i - Ke_j)|$  $AKe_i)^T(Ke_i)$
    - $\begin{array}{l} \text{vi.} & \leq |(Ke_i)^T A(Ke_j) (Ke_i)^T A^T (Ke_j)| + \\ |mK'J_{1\times m} \frac{\epsilon\delta}{K'm^2} J_{m\times 1}| & + \\ |\frac{\epsilon\delta}{K'm^2} J_{1\times m} mK'J_{m\times 1}| \end{array}$
    - vii. =  $2\epsilon\delta$ .
    - viii. Therefore using (1) and (vii), verify that  $|e_i^T(K^TK)e_j| = |(Ke_i)^T(Ke_j)| \le \frac{2\epsilon\delta}{|g_b-g_a|} \le 2\epsilon$ .
  - (d) Otherwise if  $c \neq d$ , do the following:

- i. Using (1), verify that  $K_a{}^TK_b = K_a{}^TK_a$  is a  $\mathcal{D}_{*,*}(\mathbb{Q})$ .
- ii. Therefore verify that  $(Ke_i)^T(Ke_j) = (K_ae_c)^T(K_be_d) = e_c^T K_a^T K_b e_d = 0 \le 2\epsilon$ .
- 8. Therefore using (7), verify that  $|(K^TK)_{i,j}| \leq 2\epsilon$  for  $1 \leq i \neq j \leq m$ .
- 9. Using (1), verify that  $(K^TK)_{j,j} \ge \operatorname{disc}(A) > 0$  for  $1 \le j \le m$ .
- 10. Yield the tuple  $\langle K, C \rangle$ .
